No part of this book may be reproduced in any form or by any electronic or mechanical means, including information storage and retrieval systems, without written permission from the author, except for brief quotations used in a book review.

This is a work of fiction. Its characters, conspiracies, companies, motives, and hidden connections are products of the author's imagination. The novel uses real places, public institutions, technologies, foods, buildings, and the public debate over artificial intelligence as setting. Nothing in the story alleges undisclosed conduct by any real organization or person.

The companies Aster Relay, Talud, Ternhaven, Morrow Array, Banca Roveda, Fides Custodia, and the Piedra Sola Energy Campus; the software systems Inspeximus, Murmur, Hashcairn, and NamedWitness; the community forge La Forja Sur; the Cable Rojo club; the bulletin published as Cuaderno del Paralelo; and every act, record, publication, and statement attributed to any of them are wholly fictional. The Southern Cone Digital Assurance Forum described in these pages, its programme, its speakers, and its participants are likewise invented, as are the documents, dossiers, and accusations that appear in the story. Real places, public institutions, standards, technologies, currencies, and consumer services are mentioned descriptively. No misconduct in this novel is attributed to their real operators, employees, or officials.

AI use: artificial-intelligence tools assisted with parts of the drafting and editing of this book. The front-cover artwork and lettering were generated with an image model to the author's direction. Every creative decision, revision and final approval is the author's own. Copyright is claimed in the text and in the human-authored cover layout, back-cover and spine typography, and selection, not in the AI-generated front-cover raster standing alone.

Published by Jacob Verhoeks

For those who keep the archive, and those who sign their names.

Twelve days before the largest zero-day auction of the year settles in Patagonia, a platform engineer in Buenos Aires finds four quiet pods doing work nobody will name.

Their receipts are valid. Their signatures are real.

One of them certifies a test environment nine minutes before that environment exists.

Somebody has already decided what the market will call true.

They are not spies.

They will have to do.

Prologue: Before the Test

Piedra Sola, Río Negro. Three weeks before.

The second case was warm before Lucia Barrenechea signed for it.

Wind drove grit across the loading bay. She held one hand flat on the rail while the courier balanced his tablet against the three grey cases.

Three cases arrived on the Thursday delivery, sealed in grey polymer with Talud's custody tags threaded through the hasps. Witness appliances. Lucia signed for their arrival at 16:40 under the floodlight above the bay, because the light was for exactly this: proof of condition at handover. The driver held out a tablet for her countersignature and kept his other hand in his pocket against the cold.

"Battery conditioner in number two ran during transit," he said. "It's noted on the manifest. They run warm. Nothing to check."

Lucia read the manifest. There was no note about a battery conditioner.

She said so.

The driver looked at the screen, then at the case, then at the wind moving grit across the apron, and chose the road. "It's noted somewhere," he said. "They're sealed, señora. Your job

starts when you break them."

Her job had started eleven years earlier, when she had come back from Neuquén with a thermal engineering degree and a rule she had never needed to write down: equipment tells you its history if you let it sit still long enough. She put the three cases on the inspection bench in the annex, spaced apart, and let them sit still.

At 17:20 she laid the back of her fingers against case two.

Warm.

Not sun-warm and not engine-warm. The cases had ridden in the unheated section of the truck for six hours from Bariloche, and the annex sat at fourteen degrees, and case two returned heat like a laptop that had been working in a bag. Cases one and three were at annex temperature. Case two was at thirty-one degrees and still warm after forty minutes on the bench. Something inside had supplied heat. The casing could not tell her what.

She photographed the manifest. She photographed the thermometer. She wrote the time on the whiteboard with the grease pencil that lived on a string, because the annex lost network whenever the wind decided the dish had heard enough.

The trial was scheduled for that night. Talud's coordination message gave her a window between 22:00 and 23:00, a target environment to power, and a list of observations so short it was almost an insult. Power the twin. Confirm telemetry. Touch nothing else. The appliance crews would do their own work behind their own seals, in the hall she was contracted to maintain but never enter.

Lucia had spent a decade around energy customers who modelled reservoirs and grid demand and the fatigue life of

turbine blades. Confidentiality was normal in that business. Everyone's data was someone else's headline. But those customers sent her failure modes and asked questions. Talud sent her a window and a signature line.

At 22:14 she brought the target environment up.

It was a digital twin, though nobody used the word honestly. To Lucia it was a rack of instrumented compute pretending, with great precision, to be something else: a fictional product estate with services that started in a scripted order and sensors that reported loads no physical machine would ever feel. She watched the boot sequence settle, confirmed telemetry flow to the collection bus, and initialized the run clock. 22:14:02. She wrote it on the whiteboard because the whiteboard did not need the network.

At 22:31 the receipt printer in the annex chattered.

Nobody had told her there would be a printer. It was an ugly office device on a shelf above the patch panels, plugged into a circuit she had not energized, and it produced three slips while she stood there with a screwdriver in her hand. Quorum certified, the slips said. Effect confirmed. Custody continuous. Each carried signatures she did not recognize and a timestamp block that began:

22:05:02.

Nine minutes before she had powered anything.

She checked the run clock first, because you always check your own instrument before you accuse the world. The run clock agreed with the whiteboard and with her watch. Then she checked the printer's own menu, thinking some regional setting had shifted its stamps into another zone. The printer thought it was exactly where it was.

The customer line answered on the second ring, which told

her somebody had been waiting on it. A man with a Madrid accent and the patience of someone reading from a card called it clock skew. He said distributed systems disagreed about time all the time. He thanked her for flagging it. He asked her, in the same breath, to countersign the physical delivery record for the three appliances, confirming receipt in good order and condition, so that custody could be closed out cleanly before the trial report issued.

"You received them sealed," he said. "That is all the countersignature covers."

"That is not all it covers," Lucia said. "It covers the condition I received them in. One of them was warm."

The pause had a shape she recognized from warranty arguments: a man deciding how much of her he needed.

"The seal is intact," he said finally. "Internal state is outside facility scope. Please countersign, señora. The trial closes tonight."

She countersigned one line and not the other. In the condition field she wrote: *Seals intact. Case 2 warm on arrival at 16:40, ambient 14 °C. Manifest makes no note of conditioner.* She wrote the time she had broken each seal, and only that. Let the document say what she knew and nothing she suspected. A record that claimed too much was worth exactly what its weakest claim was worth, and she had watched lawyers discover that arithmetic on other people's behalf.

Afterwards she swept the annex. The packing crates went into the compactor behind the maintenance shed, standard disposal, except that Talud's disposal bins sat outside her custody contract, which meant anything she threw away stopped being hers and started being evidence she had surrendered. So she cut the thermal strips from the inside of the crate lids first.

Battery-conditioner or not, the irreversible indicators retained a crossed temperature threshold after the packaging cooled. They could not tell her when it happened, how many times, or what supplied the heat.

Case two's strip had crossed forty degrees. The others had not. She photographed all three beside the case labels before cutting them free.

She folded the strips into the zip pocket of her jacket, meaning to log them properly in the morning when the network came back, and went home along the plant road with the wind shouldering the car towards the verge. Below the road the valley lights of the town sat in their usual handfuls. People lived here. Trucks came through at all hours with loads that had paperwork. In eleven years she had learned that the interesting question was almost never whether machines behaved. Machines behaved. The interesting question was who had already been paid to expect it.

In the annex, case two cooled through the small hours, giving up its heat by degrees into air that smelled of dust and cold solder.

In the morning she held the strip to the kitchen window. The mark matched her photograph. It said only that the packaging had been hot, and that narrow fact was more than the completed delivery record admitted.

Her phone held a message from Talud: *Please confirm destruction of all transit packaging, including condition indicators.*

She put the strip in an envelope and left the message unanswered.

Part One: Human in the Loop

Buenos Aires, twelve days before settlement.

Chapter 1: Nine Minutes Early

The receipt was committed at 04:13:08 on a Thursday morning in August, for a test environment that became ready at 04:22:41, after provisioning began at 04:19.

Sofía Alvarez learned this in the other order, because that is how incidents arrive. First the pager, at 04:23. Then the dashboard. Then, much later, the order of events itself, which turned out to be the entire problem.

The page reported missing lifecycle acknowledgements in Aster Relay's regional cluster. Usually a stalled controller. But the customer status attached to it said something else, and she had read eleven years of these lines.

Confidential workload: verification suite completed. 100% pass rate. Duration 0m 41s.

Completed. Not failed, not degraded, not flapping between green and amber the way test suites did when they were honest. Completed, with a pass rate of exactly one hundred per cent, against a customer whose workloads never reported anything at all. That was the arrangement. Aster Relay, a Seattle observability-software company with a small engineering office in Buenos Aires, sold telemetry to a legitimate energy-

research account, the account ran confidential verification jobs on isolated capacity. Sofía could inspect lifecycle metadata and signed status envelopes; test contents stayed sealed. She kept the pipes healthy. In four years the workloads had produced metrics like a heartbeat produces sound: proof of life, nothing else.

Outside, Palermo was at the hour when the street sweepers finished and the first delivery motorbikes had not started. Her building's WhatsApp group was quiet. The window over her desk held the wet green smell of the plaza after rain, and the humidity sat on the laptop's aluminium like a second casing.

She opened the workload's namespace.

Four pods, running since 03:58. Low load was an understatement. Each pod idled below two per cent of its CPU request, memory flat, network negligible. They were not crunching anything. A topology-spread rule placed them across three worker nodes, two on one and one on each of the others. Separate processes, not four independent machines.

And they were emitting. Small payloads, every few seconds, to an endpoint outside Aster Relay's estate, through the account's allowlisted metadata gateway. The route was authorized. Compact signed statements went out; a copy remained in the support journal she was permitted to inspect. She opened one there.

It was a receipt. Effect confirmed. Environment matched commitment. Cleanup verified. Custody continuous. Three signature blocks, chained. The wording was dense and legal and strangely familiar, the way a voice on the phone is familiar before you place it. She put that aside. First the arithmetic.

The receipt certified a completed verification run against a named environment: `tw-audit-07c`, provisioned under

the confidential account's project. Sofía pulled the environment's own record from the control plane. Provisioning for `tw-audit-07c` began at 04:19. The container image finished pulling at 04:21. The environment registered ready at 04:22:41.

The receipt committing effect confirmed was signed at 04:13:08.

Nine minutes and thirty-three seconds before readiness. More than five minutes before provisioning had even begun.

She did what the training in her head told her to do, which was to assume she was the malfunction. Clock skew first. Distributed systems disagreed about time constantly; every engineer eventually learned that *now* was a local opinion. A slow signing clock or a fast control-plane clock could reverse the apparent order without reversing anything else.

She pulled the time-sync telemetry for all three worker nodes. Each node held lock on its upstream sources, drift under four milliseconds, no step changes in forty days. She checked the registry timestamps against the image digest log, against the load balancer's access log, against the storage layer's own write path. The records agreed. That was useful, but agreement was not independence: several could inherit the same bad time source.

Retries next. A stale cache could serve an old object under a new name. She forced a cache bypass and re-read the environment record straight from source. Provisioning accepted at 04:19, ready at 04:22:41. A new object UID, no earlier incarnation under that name. The separately retained audit stream agreed.

She opened an incident and marked it for urgent human assessment when she wrote the summary sentence and read

it back.

Witness receipts for confidential verification workload predate the existence of the environments they certify.

She overlaid the container CPU counters with node package power. The witness processes had used brief bursts of CPU at 04:05, then settled. The larger node power rise accompanied the test at 04:23. Temperature described the machine, not an individual pod; it could corroborate activity, not identify a signer.

The node collector also recorded elapsed time against a boot identifier. On the worker hosting both a witness and the target, receipt handoff preceded target startup within the same uninterrupted boot. No conversion between clocks was needed for that comparison. She preserved the raw samples for Martin to check.

Sofía sat back and let the apartment make its small sounds: the fridge, a motorbike two streets over, the building's water pump cycling somewhere below the floor. The receipt claimed a completed test. Every lifecycle record put the test later. She could challenge the collector next. She could not explain this by changing a time zone.

Not prediction. Prediction would have been frightening enough, some model inferring outcomes before the test ran. This was worse and also simpler. Nobody had predicted anything. Somebody had known.

She wrote the incident timeline, each entry with its evidence link, each claim sized to what its source could support. It was a good document. She felt the small professional satisfaction that always came, even before dawn, of a timeline that would survive hostile reading. Then she considered the escalation field, and the confidentiality wrapper around the

account, and the fact that whatever she had found lived inside pipes she was paid to keep boring and contents she was paid not to read.

She called Martin Vale anyway. Toronto was one hour behind, but Martin kept incident hours the way other men kept cigarettes, and on the third ring he answered with the flat clarity of someone who had never once been asleep on call.

"Tell me you're not paging me about the region failover."

"I need your eyes and I need you to tell me I'm stupid," Sofía said. "A confidential workload just filed passing grade on a test environment nine minutes before the environment existed. The clocks are clean. The hardware counters agree with the timestamps. Martin, the receipts are older than the machine they describe."

Silence on the line. Not the silence of someone half asleep. The silence of someone reordering their morning.

"Send me the incident," Martin said. "Nothing else. And Sofía. Which account?"

"You know I can't say that on a call."

"Which account," he said again, gently, and something in his gentleness frightened her more than the graphs had.

She gave him the incident number and nothing else. After he hung up she went back to the dashboard, because the last thing an SRE does before waking the management chain is make sure the fire is where she thinks it is.

She built a replay before escalating.

She used the account's designated diagnostic namespace, where the support agreement permitted synthetic lifecycle checks. A fresh deployment, an empty service reporting ready after provisioning, nothing from the sealed test. If the receipts came from a stale template, a retry bug or a broad

rule matching any environment of that class, her decoy might attract one.

She named it with a random identifier, then wrote the identifier by hand before creation so she could not unconsciously adjust the record later. At 05:41:02 she submitted the deployment. At 05:41:19 its pod existed. At 05:42:07 the service became ready.

The four pods ignored it.

She deleted the decoy and repeated the test with the customer's naming pattern but none of its labels. Ignored. She added the broad verification label visible in the authorized metadata. Ignored again.

At 05:48 one pod opened a connection towards the sealed-test namespace for less than a second. It transferred no measurable payload. The connection closed. Twelve seconds later a customer controller created a commitment object containing a target identifier Sofía had never seen.

All four witness pods changed state together.

They were not accidentally signing whatever passed nearby. They were waiting for a specific future name.

Sofía exported the decoy chronology into the incident and marked it *negative control*. The phrase comforted her. A negative control belonged to experiments, and experiments ended with conclusions. This thing had noticed her experiment only by not reacting to it.

The on-call chat showed three colleagues awake in other regions. She could page one and divide the knowledge immediately. She could also expose a confidential tenant to someone without the customer exception. At Aster Relay, correct escalation was an access problem before it was a courage problem.

She paged the security duty manager with the incident

number and no tenant details. The acknowledgement came from an automated assistant trained on prior incidents: *Likely clock synchronization anomaly. Confirm NTP health, node drift and region status before escalation.*

She had already done all three.

The assistant offered to resolve the alert with a standard clock-skew note. Sofía declined. It offered the same action again in a different colour, now labelled *recommended*. She declined again and chose *human review required*. Estimated response: duty reviewer notified. The incident remained open.

Somewhere a model had looked at an impossible order of events, found the nearest familiar shape and tried to close it. It was not malicious. It was saving a person from being woken by the kind of incident that usually wasted sleep.

Sofía added one sentence to the escalation: *Do not summarize chronology. Event order is the incident.*

The four pods were still running. Still idle. Still emitting their small signed certainties into the dark outside Aster Relay's estate, patient as jurors.

She looked at their output again, the payload she had copied out, and this time she did not put the familiarity aside. Effect confirmed. Environment matched commitment. Cleanup verified. Custody continuous. She knew this cadence. Tight clauses, narrow verbs, every sentence built to be defensible in a room where someone wanted to sue. She had written prose like this. Everyone in reliability had, at some point, written a clause designed to survive a lawyer.

But this was not her prose. And it was not a test report, either. Now that she read it as what it was, the payloads stopped looking like telemetry at all.

The pods were barely computing. Their product was not

analysis.

Their product was agreement.

Chapter 2: Clock Skew

Martin called back at 12:40, which was 11:40 in Toronto and proof that he had not put the incident aside.

“I read the timeline twice,” he said. “It’s clean. So before anyone makes this a story about ghosts, let’s kill it properly. You checked the node clocks.”

“Locked to upstream, drift under four milliseconds, no steps in forty days.”

“You checked the control plane.”

“Registry, digest log, load balancer, storage write path. They agree, but some share upstream time. Ready at 04:22:41, provisioning started at 04:19. The receipt celebrated its first birthday at 04:13:08.”

“Then we check the clocks you don’t own,” Martin said.

That was the difference between Martin and most security engineers Sofía had worked with. Most people, given an impossibility, reached for a bigger hammer. Martin reached for a second opinion from a machine that had no reason to lie. He had built half of Aster Relay’s independent audit plumbing years ago, back when he still believed infrastructure projects ended, and the part that mattered now was the regional audit cache: a write-mostly sink in São Paulo that ingested event streams over one-way feeds and stamped them with its own

time, from a separately managed GNSS receiver, on hardware nobody in Buenos Aires could administer.

“If your nodes conspired,” he said, “the cache is where they get caught. Stream me the window. Raw events, no summaries.”

She queued the export while she ate lunch standing at the counter, which was how she ate lunch during incidents: three cold cuts of something her neighbour had left at her door with a note about her mother’s birthday, wrapped in film, still faintly warm from the pan. The building knew her schedule better than her family did.

The audit cache answered within minutes. It had received the receipt before 04:14. Provisioning did not begin until 04:19. A sender could backdate a field; it could not put bytes into this archive before it sent them. The retained lifecycle stream and collector acknowledgements bounded delivery delay well below the gap. The cache did not prove every source honest. It made ordinary clock skew an inadequate answer.

“Billing next,” Martin said.

Cloud billing was slower. The latest usage export stopped before the incident. The next would group charges into hourly intervals, useful for checking which capacity had been billed, useless for separating 04:13 from 04:22. Sofía queued the reconciliation for when it arrived.

“It can corroborate the allocation,” she said. “It can’t date the test.”

“Then don’t ask it to.”

An alert sounded on Martin’s end, then another, then six close enough to become a chord.

“Ignore that,” he said.

“It sounds expensive.”

“It is free. That’s the problem. NamedWitness issue queue. Somebody pointed a coding agent at our parser and told it to file every suspicious path as a separate report.”

The alerts stopped. A moment later Martin swore.

“How many?”

“Sixty-three since breakfast. Fifty-seven are the same null check wearing different function names. Three don’t build. One is a prompt transcript that says the exploit is highly likely and provides no exploit. Two might be real.”

“You read sixty-three reports while we were tracing clocks?”

“I had the triage model cluster them.”

“And you trust it?”

“No. I trust it to put likely duplicates beside each other. Then I distrust them in batches.”

A child’s voice asked something away from the phone. Martin covered the microphone badly. Sofía heard cupboard doors and the word cereal, followed by his promise that he would be there in five minutes. When he returned, the alerts began again at a lower volume.

“Your co-maintainer?” she asked.

“At her paid job, where queues have budgets. NamedWitness has two people who know the old parser and one of them is making breakfast.”

“Close submissions for a day.”

“Then the one reporter with a real failure hears that maintainers don’t care. Leave them open and we teach people that volume wins attention. Rate-limit machine-written reports and everyone pastes them by hand. Require proof of human authorship and I spend my morning policing prose instead of bugs.”

His summary tool placed the new reports into four clusters while they spoke. Martin shared the view. Green scores marked likely reproduction, amber marked missing context, grey marked duplicates. It looked orderly enough to manage.

He opened one green report at random. The author said they were not a programmer. They had asked an assistant why a configuration import corrupted their project, followed its tests and attached the smallest file that still failed. The report used the wrong component name and proposed a cause that could not be true. The attached file nevertheless crashed the parser exactly as described.

“Real?” Sofía asked.

“Real symptom. Wrong explanation. Maybe old bug, maybe new. The triage model likes it because it contains a reproducible file.”

“That seems reasonable.”

“It is reasonable. So were the forty generated reproductions last month that all used the same malformed fixture and taught the score to reward its shape.”

He assigned the report to himself, then removed the generated priority label. It dropped beneath twelve other tickets.

“You may just have buried a useful report,” Sofía said.

“Yes. Or saved the hour required to find one. Both statements can remain true until I do the work.”

There was no drama in his voice, only tiredness. The models had made it possible for a person without parser knowledge to produce evidence Martin could use. They had also made it possible for sixty-two other reports to demand the same scarce hour. Intelligence had become cheap in exactly the place where attention had not.

“Five minutes,” the child called again.

“I know,” Martin said, to both demands at once.

“So,” she said. “Not skew.”

“Not skew.” Papers moved on his end. She pictured his kitchen table, the one with the maintainer stickers half peeled off it, his laptop angled away from the window because he complained about glare in every season. “One more. Node monotonic counters. Same worker, same boot. You can’t compare uptime numbers from different machines as if they share a starting line.”

“I have the raw collector records. Receipt handoff, then target startup. Same boot identifier. The power graph is corroboration.”

“I know. I wanted to say it out loud once, in sequence, so we both heard it.” He said it anyway, slowly, like a man reading charges. “The pods computed first. The receipts committed second. The environment existed third. The test ran fourth. Every honest clock agrees on the order and every honest clock says the order is impossible.”

Sofía dried her hands. Outside, a colectivo sighed at the stop below her window, and the smell of wet plane trees came up with the afternoon damp.

“There’s a version of this where I’m being played,” she said. “Somebody building a story for me out of real logs.”

“I thought about that on the walk.” A chair creaked. “If it’s theatre, it’s theatre with a budget. A source collector, lifecycle records, and a separately administered audit sink I personally architected to be annoying to forge. You don’t build all that to gaslight one SRE. You build all that when the audience is lawyers.”

“Lawyers,” she repeated.

“Or auditors. Or buyers.” He stopped there, and the silence

had a door in it that he did not open.

"Martin. You've seen this format before. I can hear it every time you say the word receipts. You say it like it's a brand name."

This time the pause went on long enough that she checked the call had not dropped.

"In 2023 I did some contract work," he said. "Verification side. Sealed jobs, independent witnesses, signed statements about whether a thing actually happened. It was good work. It paid in the currency of feeling useful." Another pause. "The statement format I signed had the same clause skeleton as your mystery payloads. Effect confirmed. Environment matched commitment. Cleanup verified. Custody continuous. Same cadence. Same narrow verbs. Somebody took the language and grew a market on top of it."

"Whose language?"

"Mine, partly. Ours, if we're being careful." She heard him breathe. "I can't explain what I know from one contract in a way that keeps you safe, and I can't explain it in a way that keeps me employed, until I check some things that take a day or two. So here's what I need."

"Say it."

"Keep my name out of the incident. Your timeline stands on its own evidence; it doesn't need a contributor list. As far as your management chain knows, you found this alone at four in the morning because you're the kind of person who reads lifecycle alerts properly. Which is true."

"You want to be un-involved from an incident you're actively investigating."

"I want my daughter to keep going to a school where nobody has heard my name," Martin said, without drama, the

way he would report a failed disk, and Sofía understood that this sentence had cost him more than the whole morning of clocks.

"Two days," she said. "Then I escalate with or without you."

"Two days." Relief changed his voice by perhaps five per cent. He was reliable about handovers; he would not let those two days lapse. "One more thing. The pods. Don't touch them. Don't restart them, don't cordon the nodes, don't give your on-call any excuse to drain them. Right now they're witnesses pretending to be furniture. If you disturb them, the story becomes that you broke them."

"And if I leave them running?"

"Then whatever they certify next, they certify into a record you already flagged. That's not nothing. That's the only position with any leverage in it." He paused again, and when he continued his voice had the careful flatness of a man choosing each word on the way past. "Whatever this is, two different parties are being described to each other by machines they trust. Do not let either side own the time."

The call ended. Sofía washed her cup, dried it, and set it upside down on the rack, because procedure was what her hands did while the rest of her thought.

On the dashboard, the four pods idled below two per cent, patient as furniture. At 15:07 local time, one of them emitted a new payload. She opened it.

Effect confirmed. Environment matched commitment. Cleanup verified. Custody continuous.

A new receipt, for a new environment, provisioned under the same confidential project. She pulled the environment's record with the cache bypassed before the page even finished

loading.

At 15:16 the creation event arrived. She refreshed the record. Same identifier, new object, nine minutes after the receipt.

Whatever the machinery was, it was not finished. It had simply been waiting for business hours.

Chapter 3: Customer Exception

The duty reviewer had preserved the evidence before breakfast. By 17:00 the incident had grown a video call with six people on it, five time zones and one man who could decide what happened to the next run.

Daniel Cho joined last, from Seattle, camera on, flat midday light behind him from a window he never turned towards. Director of security, sixteen years at three companies, the kind of executive who read the timeline before speaking. Sofía had met him twice in person and both times had watched him ask the one question nobody else thought to ask. She had been on his side of exactly none of this before.

"Walk me through what you can prove," he said. "Not what you suspect."

She walked him through it. Lifecycle records, elapsed-time samples from one uninterrupted boot and receipt arrivals at the independent São Paulo archive. Billing could check capacity later; it had no vote on the seconds. Receipts older than their referenced environments, twice, about nine minutes each time, like a signature notarizing a document before the ink existed.

Daniel let her finish. Then he was quiet for four full seconds, which in executive time was a speech.

"Thank you," he said. "We have found no provider intrusion or unauthorized data transfer. That does not resolve what you've found."

Her manager started to outline remediation options. Suspend the workload. Cordon the nodes. Revoke the service account issuing the receipts. Reasonable verbs, all of them, the standard toolkit for making a strange thing stop.

"None of those," Daniel said. "Sofía, are your pods authorized under a customer exception?"

"I don't know what they're authorized under. That's rather my point."

"They are." He said it without looking away from the camera, and she watched him spend something to say it. "There is a confidential customer exception on this account covering defensive verification workloads. It predates my stewardship of it. This account uses batch warrants: a sponsor lists the runs, and a separate custody registrar binds them to an approved witness schema. Both signatures are supposed to travel together. During migration we accepted the sponsor's renewal without obtaining the registrar's renewed schema binding. The workload class stayed the same. Signed attestations about sealed test environments. I can't tell you the customer's name. I can't describe what their tests verify. I can tell you that the stated purpose was defensive research verification, and nothing in your evidence contradicts that purpose."

"Everything in my evidence contradicts the physics of that purpose," Sofía said. "A defensive verification suite certified a result before the thing it verifies was created. Whatever the

exception authorizes, it is being executed backwards."

"Or forwards," someone from her manager's team said, too quietly, and then apologized.

Daniel ignored it, which was its own kind of confirmation. "Here is what the account's agreement says. We provide observability. The receipt traffic uses the authorized metadata route. Those signing keys belong to the witnesses, not to us. I can place a protective hold on the batch, but I have to state why and answer for the interruption." He looked away, reading. "We have evidence against the claims. We have not yet established which part of the warrant is false. That is what the integrity review must resolve."

"So we do nothing."

"We do our jobs," Daniel said. "You restore the required dashboard without altering the incident archive. The security incident closes as no provider compromise. The anomaly stays open under exception-integrity review. No expansion of the exception while that review is unresolved. The sponsor and custody registrar receive the same preserved record."

"And if the sponsor signs the same answer again?"

"Then the review tests the representations we were given and the controls we actually own," Daniel said. "It does not invent authority over a customer's workload because we dislike the answer."

Nobody spoke for a moment. On the call, her manager unmuted to confirm the closing actions, and Sofía watched the incident acquire its ending the way a river acquires a border: by agreement, downstream of any rocks.

"One question," she said. "Off the record, in the sense that I'm asking it anyway."

Daniel waited.

"The exception has a named sponsor. Is the sponsor aware that the workload's output precedes its input?"

"The sponsor is aware of everything in your report," Daniel said. "It went through the channel an hour before this call. Which is why I can also tell you this, and then I'm done talking around my own contract." He leaned towards the camera. "Nothing in your environment is going to disappear. No logs will roll over early, no dashboards will lose history, and nobody at this company will rewrite your timeline. You wrote it well. It stays exactly as you wrote it. The warrant contains a finite run list. No additions, no renewal while the registrar's answer is missing. I am allowing that listed batch to finish; I could hold it, and I am choosing not to on evidence I cannot yet validate. Restore the required dashboard, close the security incident, and take the win you actually got, which is that you proved something impossible and it survived contact with management."

The call ended. Her manager sent a closing summary with the word *anomalous* in bold. The security incident turned grey in the queue, resolved, no provider compromise. Beside it, a new integrity case remained amber, evidence preserved, sponsor validation pending.

At 17:18 the amber case acquired a response. The sponsor attested that the exception's purpose and workload class had not materially changed since migration. The sponsor's form confirmed the keys and workload class. The registrar's separate field, binding those signatures to observed tests, remained blank. The interface displayed *existing batch permitted*. Daniel's name sat beside it.

The closing action did not close the work.

At 17:26 the customer exception opened a priority request

against her team. The four witness pods had lost two dashboard panels during Sofía's investigation. The panels were not broken. She had narrowed their query window so the impossible sequence could not be averaged into a normal one. The request called that a monitoring gap and asked for the original aggregation to be restored before the next sealed run.

Her manager assigned it to her because she already had context. The phrase was ordinary enough to feel designed.

Sofía opened the runbook attached to the exception. Most of it was standard Aster Relay language about tenant isolation, key rotation and escalation contacts. The last page described the customer-specific health condition. A witness group was healthy when three of four members reported a common result inside a bounded window. The system did not care which member had observed which test. It cared that three signatures agreed before the window closed.

Quorum, not observation.

She read the sentence again. In an ordinary distributed system that distinction was useful. A database replica did not have to watch a customer type every row; it had to agree on the committed order. Here the thing being ordered was evidence. Three machines could agree that an event had happened without any one of them being able to show when it began.

The next run was scheduled for 19:00. Its target environment did not yet exist. The provisioning ticket contained a blank identifier field and a customer note: *allocation supplied at execution*.

Sofía saved a working copy of the query definition inside the restricted incident workspace. She added a panel beside the required one that showed every receipt as an individual point instead of reducing the group to a green line. That was

not forbidden. It was also not what the customer had asked to see.

At 18:41 the first witness changed state from idle to ready. CPU remained flat. No image pulled, no volume mounted, no network path opened towards the account's sealed-test namespace. At 18:43 the second changed. At 18:44 the third.

The aggregate panel became green.

On her diagnostic panel, nothing had happened.

She checked the health expression. Readiness alone could not satisfy it. The expression expected a signed result, a target identifier and a completion code. She expanded the raw series. All three were present, hidden below the dashboard's collapsed detail: a shared target identifier in the series labels, three success values, three signature timestamps. The envelope schema separated reserved capacity, a prepared witness, a ready target and an observed test. These receipts claimed the last of them.

The target field on the provisioning ticket was still blank.

At 18:47 a fourth receipt arrived and the group rotated one member out, as if a shift had ended. The customer dashboard showed one continuous green block. Her panel showed four separate claims about the same unnamed thing.

She opened a support draft, attached the raw labels and stopped before submitting. Daniel had not told her to ignore evidence. He had told her what the company could act on today. A support ticket would go through the contractual channel to the exception holder, the same channel whose sponsor had already answered by asking for the aggregation back.

At 18:52 the provisioning ticket populated.

The identifier matched all four receipts.

This time the receipts were not nine minutes early. The old-

est was eleven.

Her manager messaged: *Panels restored? Customer is waiting.*

Sofía could leave her individual panel in place and turn a contractual request into a continuing investigation, or she could restore the dashboard and become the person who made the impossible sequence look healthy again. She searched the runbook for a third choice and found the one professionals used when the available verbs were all too large.

She restored the required aggregation. Then she added the raw-label query to the incident archive, recorded its checksum in her handover notes and wrote that the green health state did not establish observation order. The sentence would not stop a run. It would survive one.

At 19:03 the sealed environment began accepting traffic. At 19:08 it reported the same completion code the witnesses had already signed. The aggregate stayed green throughout, a perfect service belonging to a sequence that could not have occurred.

The priority request closed automatically. Panels restored. Integrity case open.

Sofía sat in the blue hour of the apartment. Somewhere below, the parrilla smoke of the block's first dinners came up the light well with the sound of a radio tuned to a news station. She had done everything right. Escalation, evidence, chain of custody, honest timelines, a director who preserved her work and chose to keep a disputed batch alive.

That was what frightened her. She had spent the day assuming the obstruction would arrive wearing a mask: deleted logs, a forged message, a manager with a new priority. Instead the machinery had preserved her finding and contained none of its consequences. The continuation had a finite scope and

a named owner. It still left room for four pods to certify the future while the record showed that a competent professional had been heard, taken seriously and thanked.

She checked the dashboard once more before closing the lid.

The pods were still there. Low load, low light, waiting without effort. At 19:12 another receipt crossed the wire, effect confirmed, custody continuous. She waited. At 19:21 a provisioning record appeared for the same target.

Restore service, the contract said, to a system whose output she could prove preceded its input.

She closed the laptop. In the dark screen her own reflection held for a moment, faint and doubled, a woman signing off on a shift that had not ended at all.

Chapter 4: Signed by a Person

The invitation arrived on Friday morning through the normal channel, which was her own inbox: Aster Relay's community relations group forwarding an event calendar, one line among forty. *Southern Cone Digital Assurance Forum, Recoleta, Friday 13:00. Open to industry partners.*

She would not normally have gone. But the incident was closed, the pods were still certifying the future at a rate of roughly one receipt per business morning, and Martin had gone quiet in a way that had a shape to it. Two days, he had said. She had a little over a day left of them, and nothing to do with the waiting except stand in rooms where information might be walking around.

The forum filled a Recoleta hotel ballroom with the international dialect of venture capital: bad coffee, excellent air conditioning, name tags with flags. Panels on sovereign compute. A minister's video message. Clusters of people comparing time zones between Buenos Aires, Zurich and Miami. Legitimate money, mostly, doing legitimate things, and Sofía wore her Aster Relay badge and let the room assume she was procurement.

Noa Vermeulen found her at the second coffee break.

“Platform reliability,” Noa said, reading her badge with an expression that suggested the badge was a sentence she was translating. “Then you are the person who keeps the pipes boring.”

“That’s the job description.”

“Noa Vermeulen.” A card appeared between two fingers, matte cream, no title. “Market structure consultant. Before that I wrote rules for a living, for a standards consortium that no longer exists under that name. Now I am paid to notice when they are broken.” A pause exactly long enough to be deliberate. “Sit with me? The panels are better from a distance.”

They took the small table by the window, away from the buffet. Noa ordered for both of them without consulting the menu, in Spanish that carried no apology, and waited until the waiter left before she opened the conversation proper.

“An anomalous telemetry incident closed yesterday,” she said. “Urgent assessment, closed as no provider compromise, integrity review pending. Four workloads, three nodes, one very good timeline written by a senior engineer who does not appear to sleep.” She turned the coffee cup a quarter turn on its saucer. “I would like to talk about what it proves, because I think you already know what it proves and are pretending, professionally, that you do not.”

“You have access to Aster Relay’s incident queue.”

“The sponsor circulated the support summary with its batch papers. I have that. The queue itself I am politely not asking about.” Noa smiled briefly. “Here is my position, and it is not a recruitment pitch, because you are not the person I would recruit. It is context, offered to someone who found herself standing inside a market she has not been told exists.”

For the next twenty minutes, over food neither of them touched much, Noa laid out Ternhaven's case the way a lawyer lays out facts she intends to repeat under oath. Zero-days were dangerous claims. A claim that could not be tested without being received was an instrument that travelled wrapped. Generated code had uncertain training lineage; nobody could say what a model had seen, whose work it had digested, or why a particular candidate had surfaced on a particular night. Volume was its own attack: a thousand plausible reports could bury the one real finding a volunteer maintainer had time to read.

"So a market exists for these claims whether decent people participate or not," Noa said. "It settles in the dark or it settles somewhere with lights. We are the somewhere with lights. Every claim we sell carries a named human who understands it, can reproduce it and can be held responsible for it. Not a logo. A person, with a name, who signs."

"And if the model found it first?"

"Then a human finds it again, understands it and signs. Origin is a question about labour. Custody is a question about safety. We sell custody."

Noa opened a slim folder she had brought to lunch and removed a single page. Names, targets and technical content were blacked out. What remained was a sequence of decisions.

"This claim arrived last year," she said. "A model produced it overnight. The candidate reproduced against a twin. Three brokers called it confirmed before breakfast. Our reviewer refused to sign because the reproduction required a service state the report never explained."

"Was the finding false?"

"No. It was worse. It was true under conditions the buyer

could not safely recreate. The model had inherited a privileged test state from an earlier candidate and used it without identifying it. The claimed path did not create access; it began after access. Sold as written, it would have caused a buyer to test the wrong boundary on a live system while believing the dangerous step had already been proved.”

The reviewer had spent nine days reconstructing the state. During those nine days the market called him obstructionist. On day ten he signed a narrower claim that removed seventy per cent of the original price and all of the ambiguity.

“His name?” Sofía asked.

“Redacted.”

“You just told me names are the product.”

“The buyer received it. You are not the buyer. Custody includes refusing an audience.”

Noa turned the page over. On the back was a handwritten paragraph, copied from the reviewer’s statement. He described what he reproduced, what he could not reproduce and the exact state he had been given rather than earned. The language was spare, narrow and recognizably human not because a model could not have written it, but because somebody had chosen what not to claim.

“That person prevented harm,” Noa said. “Not by finding faster. By being slow in a market that punished him for it. When people tell you human review is nostalgia, they omit that the human is where the cost of refusing speed currently lands. We make that refusal valuable enough to survive.”

“And if he had been wrong?”

“His name would still be on it. He could be challenged, removed, sued, remembered. A model can be retrained and renamed. Accountability cannot begin with a version number.”

Sofía read the handwritten boundary again. It was a serious answer. It was also a luxury answer. Nine days of a rare expert's time, legal protection and a buyer willing to wait. She thought of every small team whose true finding could not afford to become respectable at that rate.

"Who paid for the nine days?"

"The rejected portion of the claim."

"So custody is available when the finding is valuable enough."

"Everything scarce is rationed somehow. We ration by responsibility and price. Morrow Array rations by evaluator score and queue position. Only one side admits it is a market."

Sofía turned her cup to match Noa's quarter turn. "You described my incident in detail for someone outside the company."

"I described a summary of your incident."

"You also know where my salary comes from when it leaves the country."

The room noise went on around them, the panels, the laughter by the buffet, and Noa did not blink or glance away, which was its own kind of answer.

"Banca Roveda," Sofía said, very quietly.

"A respectable institution with one inconvenient client." Noa folded her hands. "Here is the offer, and I will make it once. Ternhaven retains external counsel in Buenos Aires, excellent ones, who regularize foreign income and historical non-declaration every day, quietly, correctly, permanently. You would pay nothing. In exchange, when the moment comes, and it will come, you provide us the independent timing record you already hold. The regional cache. Nothing else. Not exploit contents, which you have never had. Timing."

"And if I refuse?"

"Then you remain exactly what you are now. An engineer with an anomaly she cannot report and a bank account that could end her career twice." Noa stood, collected both cups and set them on the tray, an oddly domestic gesture. "But you should know that I mean the other part sincerely. Someone must be able to sign for dangerous code. If you ever find a different answer to that problem, a better one, I will listen to it. That is not flattery. It is the only reason I am still in this business."

She left a banknote under the saucer for the waiter and walked back into the ballroom crowd, and Sofía sat alone at the window table doing honest accounting.

Because the case was good. That was the trap inside the threat. Every clause of it matched the thing she believed: that responsibility needed a name attached, that evidence needed custody, that somebody had to be able to stand up in a room and say *I checked*. Noa had taken Sofía's own private grammar and handed it back to her with a price list.

The waiter came to clear the table and paused, apologetic, holding the card terminal.

"The lady paid cash," Sofía said.

He turned the terminal towards her, mildly confused. On its screen was an authorization request, pending, for the exact amount of lunch. The card it named was hers.

Her corporate card, which was in her desk drawer at the office in Microcentro, where she had left it at nine in the morning.

Chapter 5: Proof of Lunch

The terminal was a mistake, or a message, and Sofía spent the taxi home deciding which.

A pending authorization could be a cloned card, and cloned cards were weather in Buenos Aires; everyone she knew had a story about a Friday night in Palermo and a Monday morning full of Neuquén. She did the boring things first, from the back seat, on her phone. Freeze the corporate card. Freeze the personal one. The bank's app made her authenticate twice and then confirmed both cards cold at 16:51.

Then she opened the expense system, because she wanted to see the charge in its natural habitat before reporting it, and the habitat was wrong.

The authorization had posted at 13:44, during lunch, at the hotel where she had sat with Noa. Amount matching the set menu. Incident habit made her pull the neighbouring records before reporting anything, each exported from its own system into its own tab. Laid beside the charge, two of them were entries no clone could explain, because they were not charges. They were corroborations. A building access record from the facilities portal: her badge, the hotel's conference wing, 12:58. A device-risk signal from Aster Relay's own security stack, in the self-service export any employee could down-

load: her phone observed on the venue network from 12:40 to 14:20, posture compliant.

She had badged in. Of course she had badged in; it was a work event. Her phone had joined the venue Wi-Fi, of course it had; the ballroom signal was poor. Each record was true. Each record was hers. Together, with the charge, they composed something that had never happened: a meeting the expense tool had approved straight from the card feed, between an Aster Relay engineer and the seller's consultant, documented end to end, on the day that a Talud verification window opened in Neuquén at 13:30 local time and closed at 14:00.

She knew the window because she could read the integrity case. The batch warrant attached to it listed its runs by site code, not by customer, and one line said *NQN-2, Friday, 13:30 to 14:00*. She knew the market because every receipt in her incident carried the same schema header, naming the exchange that issued it: Talud.

She checked the timing against what she had, which was not much: one closed incident, three early receipts and a habit of reading other people's logs. Talud's published witness rules, linked from that same schema header, let a human witness attend a sealed run remotely, from a registered venue, if three things lined up: a badge into the venue, a compliant device on a known network and a recorded session with the seller's representative. If a test had run in that window, then every record around her lunch was not surveillance. It was a participation record. Someone had built her a remote seat at a sale she had never witnessed, using nothing but her ordinary Friday.

At home she laid it out on paper, actual paper, the way

she did when she needed to see who knew what. The card number lived in four places: her wallet, Aster Relay's expense provider, the bank and whatever merchants kept tokens. The badge lived in Aster Relay's facilities system. The device signal lived in the security stack. No single party saw all four. Whoever assembled the picture had either compromised four systems or been handed four pieces by people who each thought they were doing something routine.

That was when she caught herself doing the other thing, the thing she would think about later at two in the morning with genuine shame. She was ranking. If I had to un-freeze one card tonight, which one? The personal, because the Subte needs it. And if I had to rebuild the expense trail, where would I have said lunch happened? Not the hotel. The café on the plaza, the one with the bad Wi-Fi, because I always choose the café with bad Wi-Fi when I want to be left alone with a document.

She stopped writing.

Those were not decisions a stranger could audit. Those were habits, worn down to grooves, visible only to someone who had watched her make a hundred small choices about money and routes and tables. Mateo used to read them out loud at the kitchen table, amused, merciless: *you froze the wrong card first, you always freeze the Subte card last, you chose the café before you chose the excuse.* Two years gone and she still ran his inventory of her like a checklist every time she moved money.

Except Mateo was in Córdoba, or Montevideo, or wherever volume found him. And Noa Vermeulen had left the country on the evening flight, or so her badge said, or so somebody's log said.

Sofía looked at her page of notes and understood the shape of the thing. The purpose of the lunch had not been recruitment. Recruitment had been the conversation she was meant to leave with. The purpose was the records. She had walked into a room and generated, just by being there in the ordinary way, the three records Talud accepted as remote attendance, beside Ternhaven's own consultant, at the exact hour a zero-day test certified itself in another province. If that sale ever needed a human face, hers was now attached, truthfully, verifiably, with her own badge and her own phone.

Her financial mess made it better. That was the part she made herself write down, in small letters, because it was the load-bearing fact. An SRE with clean books would call a lawyer and laugh. An SRE with an undeclared foreign account would hesitate, and hesitation was all the fabrication needed. Her past was not just exposure. It was adhesive. Every true thing she had hidden made the false things stick.

She returned to the hotel before evening, not to confront Noa but to ask the room what it had recorded.

The lunch waiter remembered them. Two women, one cash payment, no card presented. He remembered because Noa had tipped in dollars and asked him to count the change in front of her. The terminal receipt, when his manager printed it, showed a card authorization initiated at their table and cancelled after seventy-three seconds. The merchant device ID belonged to a portable terminal assigned to the ballroom bar, not the restaurant.

"Could somebody have brought it to the table?" Sofía asked.

"Of course. We had three hundred people. Terminals move."

The ballroom supervisor's inventory showed the device returned at 15:20 with a full battery and no cash imbalance. Its operator session belonged to a catering worker who had clocked out at noon with a fever.

Every local fact was harmless. A roaming terminal. A session left open. A card token presented through the hotel's payment gateway. The join was the crime, and no single employee had access to all three parts.

Sofía asked for the security video. The manager refused correctly. Guest privacy, retention policy, written request from law enforcement or counsel. She asked him to preserve the fifteen-minute window instead. He hesitated until she showed her Aster Relay badge and the fraudulent authorization alert. Then he opened an incident in the hotel's own system and gave her the number.

"Preserved for thirty days," he said. "After that, legal request or it expires."

"Who can alter the incident?"

"Security manager and corporate risk."

"Can you print the creation time?"

He did, mildly offended by her distrust and professional enough to satisfy it.

Outside the hotel she stood under the awning and photographed the paper against the building clock. A taxi queue moved through rain left over from a cloudburst. People with forum badges crossed the pavement in groups, already converting conversations into follow-up meetings.

Her phone offered a photo enhancement that would straighten the paper and extract the text. She declined. The crooked frame showed the hotel, the clock and her hand. Useful evidence often looked worse because nobody had

optimized it for belief.

She sent the incident number to a lawyer she had once used for an employment contract, then deleted the draft asking whether undeclared foreign income weakened a fraud complaint. The answer was yes in every social sense and no in the narrow legal one. She was not yet ready to discover which sense a lawyer would hear first.

At 23:40 her phone lit the ceiling. An SMS from the bank, automated:

Authorization attempt declined. Card ending 4417. Amount: 4,850 ARS. Merchant: Estación de Servicio, Ruta Nacional 22, Neuquén.

A fuel stop, more than a thousand kilometres away, on a card she had frozen nearly seven hours before. Somebody was testing whether the freeze held, or whether she would un-freeze it, the way anyone would eventually un-freeze a card, at a petrol station, late, far from home.

She put the phone face down on the nightstand and did not touch it again.

In the morning the declined attempt would still be there, one more true record in a file of true records, composing a woman who had been in two provinces at once. Sofía lay in the dark and listened to the building's water pump cycle, and understood that she was no longer investigating a market.

She was being written into one.

Chapter 6: Technical Merit

The message came through an old channel they had never closed, a bug-bounty forum private thread from 2022 with one new line in it: *Saturday, Almagro, the workshop on the corner. I'll be the one being yelled at about capacitors.*

She went anyway. That was the part she examined afterwards, more than anything else he said that day: not the meeting, which was public and ordinary, but her own yes, sent within four minutes.

The workshop was a repair collective two blocks from the avenue, a garage front where a man rebuilt e-bike batteries at a bench by the window and a woman resurrected dead stereos for a queue of people who had been told by three shops to buy new ones. Mateo sat at the back table with a plate of empanadas and his laptop angled away from the room out of habit rather than need. He looked well. He looked, Sofía thought, like a man whose bets had been paying.

"You froze the wrong card," he said, instead of hello.

"Hello, Mateo."

"You froze the corporate first, then the personal. You always protect the Subte card last, even though it's the one you

actually need on a Sunday." He turned the laptop around. "I know, because I watched you do it forty times at that kitchen table, and because someone ran the same play on you this week and you reacted exactly on script. Which is interesting, because it means either they have your habits, or they have my habits."

"And you know about this week how?"

"Morrow Array talks to me." He said it plainly, no theatre. "You found something at work. Four quiet pods, receipts older than their own environments. It made noise in places noise doesn't usually reach. I came to tell you what you're actually looking at, because nobody else will, and because you'll check it instead of believing me."

He opened a folder of screenshots, redacted down to structure, and walked her through a finding. A dependency parser, widely deployed, mostly in logistics software. Murmur, running against a fictional twin of its class, had produced a candidate flaw in eleven days: a deserialization path that let crafted input walk past validation, most visibly when a specific legacy flag was set. Real. Reproducible. Sofía spent ten minutes reading the proof-of-concept transcript with her professional face on while her chest did arithmetic about how many such systems moved parcels around the cities she loved.

"Submitted where?" she asked.

"To the market. And to the vendor, through a broker, because we do that too." Mateo's voice stayed level. "Ternhaven saw the submission format, knew it wasn't one of their named humans, and pulled the lever they keep at Talud. Derivative. Prior art, they claimed, from their own 2024 package. The receipt got labelled, the label got priced, and the vendor sat on the patch for five months because a derivative finding is a

scheduling problem and an original one is an emergency." He scrolled to the last screenshot: a changelog, finally shipped, crediting an internal audit. "Five months. Nobody hacked anybody. The market just decided the flaw mattered less because of who its parents were."

"That's one story," Sofía said. "Told by the side that profits from it."

"It's one story told with evidence. Check the dates yourself, they're all public." He pushed the empanadas towards her. "Here's the part that isn't about my side. You've met Ternhaven's answer now, the woman in Recoleta. Human names on everything. Ask yourself who can afford to sell their work that way. A named expert with custody discipline and legal cover is a luxury good. My cousin at the university writes world-class fuzzing tools and cannot afford a lawyer to read her own licence, and Ternhaven's model prices her out of her own findings. Human only means wealthy only. It always did. The doctrine isn't about safety, Sofía. It's a guild badge."

"Your doctrine has a price list too."

"Everything has a price list. Mine just doesn't have a velvet rope." He shrugged, and for a moment he was the man she had loved, the one who could make an unjust system sound like a door left open. "Reproducible output is true whether a person or a model typed the first line. Judge the result. Everything else is ancestry worship."

Before she could answer, the door opened and the room's traffic changed. A young woman came in carrying a cardboard box like it contained a sleeping animal, which in a sense it did: a ruggedized tablet, a cash box and a tangle of cabling that held together the dispatch system for a delivery operation. Behind her, a teenage rider waited with the particular patience

of someone not being paid while he waited.

“Micaela,” the battery man called out. “Tu chico está en la mesa del fondo.”

Micaela Ferreyra was twenty-seven and built like someone who had been doing four jobs since she was nineteen. She greeted Mateo with the familiarity of a client, put the box on the back bench, and explained the problem to the room in the flat tone of someone reciting weather. The compliance module had died again. The city had changed a rule about invoice codes in March; her tool, which she had built herself, prompt by prompt, over one frantic summer when paper ledgers stopped passing inspection, handled the old codes fine and fell over on the new ones. Someone from the workshop had patched it in February. Now the patch and the update fought each other every second Friday, and today the whole dispatch floor was running on a whiteboard and two phones.

The rider behind her was called Ariel. Micaela introduced him only because he had been waiting long enough to become part of the meeting. He was nineteen, studying refrigeration at night and losing money by the minute while the tablet sat open. Before Micaela built the tool, he had worked for a larger platform whose ranking decided when he saw an order and never explained why. Three missed acceptances could erase a weekend’s work. Micaela’s operation paid less on the best nights and more on the worst ones, because the riders could see the queue and argue with a person.

“The whiteboard works,” Ariel said. “It just works for eight riders. At twelve we start sending two people to the same pharmacy. At fifteen somebody’s medicine goes to Caballito.”

Micaela’s generated tool had not replaced a well-funded engineering team. It had replaced a platform nobody in the room

could appeal to, using rules none of them could inspect. For one summer it had given a small operator the ability to run a queue on her own terms. The technical debt arrived later. The independence had arrived first, and was real.

"Nobody here wrote that component," the stereo woman said, opening the tablet. "It arrived finished. There's a commit history of one author and the author is a word, not a person."

"I can explain what it does," Micaela said, defensive before anyone accused her. "Mostly. When it works."

"Mostly is doing a lot of work in that sentence," Mateo said kindly, and got up to look, because Mateo could not leave a broken machine alone any more than Sofía could leave a bad timeline.

Sofía stayed at the table and watched, because watching was her job.

Micaela knew exactly what the tool was worth. She talked about delivery windows and margins and which rule changes moved money with the fluency of a woman who had survived three governments' worth of paperwork on two wheels and a phone. And standing next to the open tablet, waiting while a volunteer coaxed her business back to life, she went slightly rigid, the way people do beside their own blind spot. She approved the fix when it was offered. She did not ask what it changed. She signed nothing, because there was nothing to sign, and everyone in the room understood the deal being made: the workshop kept her alive, and nobody mentioned that the component at the centre of her company was a thing none of them could explain, including, especially, her.

The tablet restarted. A green banner announced that the invoice-code migration had completed. Micaela exhaled, took out her phone and called the dispatch floor.

“Give it five jobs,” she said. “Not the whole queue. Five. Ariel, stay here.”

The workshop screen filled with order cards. Two pharmacy pickups, a bakery run, a document envelope and a refrigerated package from a clinic in Congreso. Micaela read them faster than the software rendered them, assigning likely riders aloud from neighbourhood, bag size and who had already crossed an avenue in the wrong direction. The program reached the same answers three seconds later and displayed them as recommendations.

“That’s what I built,” she said, looking at Sofía rather than Mateo. “Not the tax part. That. It remembers the street when I can’t hold all of it in my head.”

The clinic package went to Ariel. His phone chimed. Then it chimed again, cancelling the job, and the bakery card moved into his place. Across the room Micaela’s phone began ringing.

“No,” she said before answering. “No, no, no.”

The migration had accepted the new invoice code but reclassified refrigerated deliveries as goods requiring a commercial vehicle permit. None of her bicycle riders had one. The queue had not crashed. It had made a coherent decision from a wrong category and removed every medicine order from dispatch.

Mateo leaned over the tablet. “The mapping table is probably inferred from the description. We can regenerate it with examples.”

“Don’t,” Sofía said.

He looked at her.

“The examples are the problem. It will infer another table and we will know only that these five cases pass. Where is the rule expressed?”

The stereo woman opened three directories and found six plausible answers. One was generated documentation. One was a test fixture copied from a municipal PDF. One was a block of code with variable names in English, comments in Spanish and no commit before the day Micaela first deployed the tool.

The phone kept ringing. Micaela declined the call and immediately called the clinic. She did not hide behind the software. She said there was a dispatch error, asked how long the package could remain at room temperature and wrote the answer on the whiteboard. Twenty-two minutes.

“Ariel,” she said, “take it manually. I’ll make the invoice later.”

“Then the system says I never carried it.”

“I’ll sign the paper.”

“The platform used to say I never carried things too.”

He did not raise his voice. He did not have to. Micaela held his gaze, then pulled a duplicate delivery pad from the box and wrote the order twice, one copy for him and one for her cash drawer. Ariel photographed both before leaving.

The room lost seven minutes to a problem the green banner called resolved.

Sofía sat at the keyboard. She did not understand the application, but she understood changes that could be bounded. The old code table still existed in the February backup. The new municipal codes came from a twelve-row list Micaela kept beside the cash box because she did not trust the portal to stay available. They could write those twelve mappings as data, not ask a model to rediscover them from descriptions. They could reject any thirteenth code instead of guessing.

“The business stops on an unknown value,” Mateo said.

“That’s safe for the software and expensive for her.”

“The business already stopped. It just did it while claiming success.”

Micaela looked between them. “Can it put the unknown one on the whiteboard?”

“It can put it in a queue,” Sofía said. “A person decides.”

“Which person?”

The question quieted the technical conversation. Everyone had been speaking about a human fallback as if one waited inside the machine. Micaela had nine riders on shift, a shop counter, two phones and a tax deadline. The workshop volunteers had their own repairs. Mateo could build a better evaluator and leave. Sofía could describe a control that depended on labour no budget contained.

“Me, for now,” Micaela said. “Sundays too, until the floor closes at two. And Ariel when the category changes what he gets paid. Put both names on it.”

They made the table. Mateo typed quickly, then stopped himself and asked the model for tests rather than a replacement component. Sofía read each case against the twelve rows. The stereo woman made the application fail visibly when a code was missing. Micaela chose the Spanish error text. It took forty-one minutes, longer than regenerating the mapping and shorter than explaining a lost medicine order.

When Ariel sent the delivery photo, the new queue accepted the clinic invoice and kept his manual assignment. Micaela wrote his waiting time beside the job so payroll would not make the repair his donation.

“Now it works,” Mateo said.

“Now we know what it does when it doesn’t,” Sofía said.

Micaela tore the top sheet from the duplicate pad and

placed it in the cash box. The paper was not more accurate than the program. It was simply a record whose owner was standing in the room.

Mateo saw raw material when he looked at her. She could see him see it: capability arriving faster than institutions, proof that the old gatekeepers were optional. Later, walking her out, he said as much. "That's who the provenance cartel locks out. She's better at operations than half their named experts. Under our model, her evaluation work would be worth money."

Under their model, Sofía thought, her name would be worth money too, attached to whatever needed a signature. She said none of it. But she took the folded note Micaela left with the workshop, the one with the component's name on it, and she read it twice, because she recognized the shape of the problem from the inside.

Sofía could verify an effect without owning a use. Micaela could neither verify nor own either. Between those two sentences lay the entire argument everyone was having with such confidence, and neither faction's name was on either of them.

At the door, Mateo held out his hand like a businessman closing a meeting.

"One more thing, free of charge," he said. "Whoever is building your alibi, don't chase the records. Records are their home turf. Chase the timing. You of all people know that clocks are the one thing they have to keep honest, because the whole product is *when*."

"And if the clocks are theirs too?"

His smile faded by a degree, the first honest thing to cross his face all afternoon.

"Then you're in worse trouble than I thought," he said, "and you should call me before you call anyone."

Chapter 7: The Maintainer

The handover call was set for Saturday at 18:00 Buenos Aires time, because Martin believed that reliability was a schedule and not a mood. Eleven years of working together and he had missed four calls: two for flights, one for a hospital, one for the 2022 derecho that had cut power across southern Ontario.

At 18:20 Sofía closed the video window and opened his public trail instead, because when Martin went missing from a schedule he was always, somewhere, visible in public.

She found him fast, and what she found rearranged her picture of him.

The library was called NamedWitness. He had maintained it for six years: a small, serious tool for signing and verifying software artefacts, the kind of project with three thousand dependents and two maintainers, one of whom was now answering issue trackers in prose that read like a man shouting into weather. She scrolled back through the spring. Generated security reports had been arriving against NamedWitness all year, dozens a week, each one polished, formatted, plausible, and wrong in ways that cost an hour to disprove. In March a contributor had merged one by mistake. In April a real vulner-

ability report had sat unread for nine days under forty pages of model-written lookalikes.

Sofía opened the April report.

Its author was Nadia Ortiz, a junior developer maintaining appointment software for three neighbourhood clinics. She disclosed assistance in the first line. She had not understood NamedWitness's signing internals when a damaged appointment export began failing verification; she had shown the failure to a model, asked it to reduce the input and then reproduced the reduced case by hand. The first explanation the model proposed was wrong. The test case was not.

Martin had closed the report in four minutes.

Generated analysis of unsupported input. No demonstrated boundary failure.

Nine days later the other maintainer reopened it. Nadia answered every question she could and wrote *I don't know* beside two she could not. Between them they established that NamedWitness trusted a piece of package metadata after checking the package but before checking whether that metadata belonged to it. Nothing in the thread could be used as an attack recipe. What mattered was the social sequence: a newcomer with an assistant had found a real discrepancy, the senior maintainer had recognized the shape of forty bad reports and discarded the forty-first, and the project had been less safe for nine days because experience had become a filter too aggressive to admit surprise.

Martin's apology was still there.

You brought evidence. I classified your prose. That was my failure.

Nadia had replied: *The prose wasn't mine. The reproduction was.*

The exchange had been quoted by both camps afterwards. The enthusiasts used it to prove maintainers were obsolete. The sceptics used the forty preceding reports to prove Nadia's success was unaffordable. Nobody quoted the line underneath, from NamedWitness's second maintainer, saying she had taken a month away because triage now consumed the hours in which she used to write code.

Nadia's profile contained an email address for clinic-software support. Sofía wrote from a personal account and identified herself as Martin's colleague. She did not mention Talud or the pods. She asked when Nadia had last heard from him and expected no answer before Monday.

The reply arrived seven minutes later.

Is he all right?

Sofía called. Nadia answered from a corridor with hard surfaces and the distant sound of a number being announced. She was working Saturday because one clinic had moved its appointment export and three doctors had discovered the migration only after patients arrived.

"Martin wrote to me on Thursday," Nadia said. "Not about NamedWitness exactly. He asked whether I still had the original model transcript."

"Do you?"

"I keep everything now. People believe the disclosure only if you can show them the embarrassing parts."

She sent a link while they spoke. The transcript was not evidence of model wisdom. It contained five confident wrong explanations, two invented configuration flags and the reduction that had exposed the real boundary error. Nadia had marked each claim with what she later verified. Red, red, red, red, red, then green. The green line was shorter than any of

the wrong ones.

Martin had asked a different question: whether the assistant produced the final reduction before or after Nadia supplied a damaged real-world export.

"Why did that matter to him?" Sofía asked.

"He said somebody was treating candidate time as discovery time. The model had generated similar-looking inputs for hours. None reproduced. When I gave it the damaged export, it reduced the case in eleven minutes. If you count generation, the system discovered dozens of things that weren't true. If you count verified reproduction, I discovered one thing with help. He said a market he knew wanted the earlier timestamp."

There it was again: not who wrote the result, but which moment could be sold as its birth.

"Did he tell you the name of the market?"

"No. He asked me not to publish the transcript yet. I told him I wasn't going to hide my own work because an expert had become interested in it."

"What did he say?"

"That I was right. Then he apologized a second time, which was worse than the first."

Nadia moved somewhere quieter. "He also asked about the mirror. The NamedWitness project has a community mirror in Buenos Aires. La Forja Sur. We used it during the issue flood because the main forge rate-limited anonymous readers. By Thursday morning the mirror stopped serving one discussion thread. Not unavailable. Gone. Martin thought the thread proved when several report variants first appeared."

"Who runs it?"

"I don't know. A local infrastructure person. The contact

page is cached. I can send it."

"Please."

"And Sofía? If Martin is missing, don't describe him as the man who rejected my report. That's what people who like the story will do. He was also the man who put his mistake in public and left it there while strangers used it against him. Those are both true."

After the call, Sofía downloaded the transcript and its verification notes. She saved the public hash, not the clinic data, and added the mirror address to a list headed *things Martin touched last*. The list contained Talud, the São Paulo cache, Nadia's chronology and a volunteer forge in her own city.

At 20:03 the mirror returned a maintenance page with a timestamp from Thursday morning. At 20:04 it returned no route at all. At 20:05 the domain resolved to a different address and presented a valid certificate for a blank site.

That was not proof of deletion. It was proof that someone cared what a reader saw.

She messaged the contact address from the cached page. The message bounced. She wrote the administrator's handle in her notebook and circled it once. A public trail was not custody, but it was direction.

And in May, Martin had written the message that got quoted back at him for weeks afterwards:

Every generated report costs me an hour I do not have. You are not automating security review. You are automating the exhaustion of the people who do it for free. If your tool finds one real bug a year, congratulations, you have priced a volunteer's Saturday at zero to buy yourself a benchmark point.

Arguments followed. Some called him a gatekeeper. Some called him the only honest man in the thread. A foundation

mediator offered to help triage. The reports kept coming. In June his commits slowed. In July they stopped, except for one, a documentation change so small it looked like a goodbye: he had corrected the word *principally* to *primarily* in the README, which was the kind of edit a man makes when his hands want to touch the project once more before he puts it down.

Sofía sat with that for a while. She had known Martin as the clock man, the handover man, the colleague who remembered her mother's birthday because it was in the rotation file he kept for the team's on-call morale. She had not known about the Saturdays. Everyone in her profession knew the shape of that argument from the inside; she had simply never seen Martin on the losing end of one before.

At 21:14 her phone buzzed with a message sent through the incident platform's side channel, the one they used for things that should not live in company systems. It had been composed at 16:02 Toronto time and scheduled for delivery at this hour, which meant Martin had planned its arrival down to the minute before whatever happened to him happened.

Sofía. If you are reading this, I am not reachable, and you have already noticed the pods. Handover notes follow. Read them before the attachments.

1. The regional audit cache is clean. I built it paranoid and it has stayed paranoid. Whatever else is compromised, the timing record is not. That is why it matters, and why people will start asking where it lives. Do not tell them. Not either side. Especially not both.

2. The receipt format is mine. Not literally, but the skeleton. In 2023 I took contract verification work through an intermediary. Defensive testing, I was told, and I believed it because I wanted to believe that being the human who signs was worth something. Attachment one is the invoice. Look at who the payer is.

3. When I understood what the receipts were settling, I did what clever men do instead of wise ones. I made a record of my own. Both factions would pay for it, which means both factions will come for it, which means I thought that made me safe. Two buyers do not create independence. They create an auction. I understand that now.

4. If I go quiet, do not rescue me. Validate nothing of mine until you can prove the interval yourself. Your clocks are good. Trust the boring ones.

Do not let either side own the time.

Two attachments. The first was an invoice, photographed flat on wood grain: consulting services, verification and attestation, thirty hours monthly, issued by a shell with a registration number in a country she associated with ship registries. The payer field said **Talud S.A.**, and the payment reference said **witness-04**, and there was Martin's legal name, attached to the market she had found inside her own cluster, going back further than her incident, further than her anomaly, into the years when he had been teaching her how to read clocks honestly.

The second attachment was encrypted, keyed to a passphrase she recognized: the random recovery phrase they had exchanged for their private verification work, still sealed in the back of her old notebook. She typed it in. The file decrypted to a single page of hashes with timestamps, no explanations, titled only:

mixed continuity record: interval draft 3

She did not know yet what it mixed. She wrote down its hash anyway, on paper, in the notebook that lived in the kitchen drawer, next to the one fact she now held about the world: Martin Vale, the most honest man in her professional life, had been on Talud's payroll as a human witness, and

had tried to sell that fact in both directions, and had vanished between the bids.

Outside, Saturday night came up over Palermo the way it always did, doors and music and a scooter with a bad exhaust doing wheelies on the corner. Sofía closed the notebook and put the kettle on, because her hands wanted procedure and there was no procedure left in the queue.

Two days ago she had found four pods certifying the future. Tonight she knew the future had witnesses, that witnesses could be bought by the hour, and that the only independent clock left in the story was a cache in São Paulo that a missing man had built to be annoying to forge.

Whatever came next would arrive asking for it.

Part Two: Two True Histories

Buenos Aires, Rosario, Paraná. Nine days before settlement.

Chapter 8: The Wallet Years

On Sunday morning, with the city hung over and quiet, Sofía did what Martin's message had told her to do in spirit if not in letter: she audited herself before anyone else could.

The notebook came out of the kitchen drawer, along with the second notebook, the older one, whose pages had gone soft at the corners from a winter of being carried in a coat pocket. She had kept records even then. That was the joke she never made out loud: the woman who hid money from the tax office kept better books on herself than most companies keep on their fleets.

She rebuilt the timeline year by year, writing balances as ranges instead of numbers, because ranges were honest about what memory could support.

2022. Remote work in dollars while the peso burned. The gap between what her invoice said and what arrived in her Argentine account was a tax on geography: withholding, conversion at the official rate, card spending surcharged into absurdity. She remembered standing in a supermarket queue doing division in her head to decide whether

the yerba was cheaper this week or last, and the answer changing between the queue and the till.

2023. Inflation at numbers that stopped feeling like weather and started feeling like altitude. Two hundred and eleven per cent across the year; the month she got married to no one and told no one anything, December, prices had risen a quarter of themselves in thirty days. Her dollar salary sat in an Argentine bank melting like an ice sculpture at a demonstration. But the melting had started long before December. In March, when the year was still only frightening, Mateo, who had been reading her statements before she read them, because that was how they were together then, put his phone on the table one night and said:

"Your next payment lands on Thursday. By Friday it will be worth ten per cent less than the invoice says. By Christmas, half." He turned the phone towards her. On it was a stablecoin order screen, dollars wearing a blockchain's clothes. "Convert the day it lands. It holds its value. You can change it back when you need pesos, in pieces, when the rate isn't insulting."

She remembered the specific quality of that moment, because it had not felt like risk. It had felt like being handed an umbrella in rain she had stopped noticing. Relief first, arithmetic later. The fee was small. The transfer took four minutes. Her money, for the first time in two years, was where she had put it an hour ago.

That was the first conversion. The notebooks recorded it as 400 USDT at 391.40, which was either careful bookkeeping or superstition, and neither of them knew yet that they were founding something.

Because the route became a habit, and the habit became infrastructure. A payment processor in Montevideo. A foreign account at Banca Roveda, opened on Mateo's advice through an intermediary he trusted, because an administrative shortcut had felt less dangerous than a question. Hashcairn had paid in Bitcoin since the first job, and soon there were spreadsheets with two columns marked *declared* and *actual*, and the gap between them grew the way gaps do, gradually and then enormously. She underreported the foreign account. She underreported some gains. Each individual decision had been small, defensible, survivable, the financial version of signing off a cleanup clause you had not fully verified, and the sum of them was a woman who could be ended by a spreadsheet.

She wrote the last balance in the range format and closed the old notebook.

Then she opened ARCA's guidance pages beside a blank spreadsheet and began listing what an independent tax lawyer would need.

Noa's lawyers were not the only path. That was important to establish before fear converted an offer into inevitability. Sofía entered ranges where she lacked exact amounts, separated foreign income, digital assets and prior years, and built the most pessimistic estimate she could defend. Tax, interest, possible penalties, conversion differences calculated as if she had chosen the worst plausible day.

The upper estimate exceeded her liquid savings. The lower one left enough to keep the apartment and very little else. Neither included counsel.

She might be able to pay over time, depending on the lawful options counsel found. Any application would require full source records, including processor statements she no longer

possessed and wallet ownership evidence that would connect her name to the chain more completely than any faction had yet managed. Regularization was possible. It was not a form, a confession and relief. It was a second engineering project with herself as the legacy system and every missing log interpreted against her.

She called an accountant whose number had sat in her contacts since a colleague's audit two years earlier. On Sunday it went to voicemail. She left only her first name and asked for an appointment involving foreign income. The act made her pulse rise more than the impossible pods had.

For three years she had described the account as a private risk. Private meant she could schedule it after the next release, after inflation settled, after the law became easier to interpret, after she had enough money to survive honesty. Now a broker she had met once could put counsel around it in an afternoon. The threat was not that legal repair did not exist. The threat was that Ternhaven could make an expensive public process feel like a private favour.

She listed what correction would affect. The emergency reserve. Her mother's dental work if Tomas needed help. The deposit on a larger apartment she had never admitted wanting. A year without unpaid leave. Risks became morally serious when translated back into the futures the hidden money had been protecting.

At the bottom she wrote: *Cost does not change ownership.*

It was a good sentence. She did not yet know whether she believed it enough to pay.

She opened Tomas's contact and let his name sit on the screen. He would answer if she called. He would ask for the number first, then the dates, then whether she had already

spoken to a lawyer. He would make the problem ordinary by giving it a sequence, and she was not ready to hear how ordinary it might be. She closed the contact without calling. The refusal felt less like protection than another entry in the account she was keeping against herself.

The new message arrived at 14:20, through the bug-bounty forum thread, the same dead channel Mateo had used to summon her to Almagro. Not from Mateo's account. From an account created yesterday, named with a string of characters that meant nothing and would trace to nothing.

No greeting. One line of text and one image.

We mapped this one. Ask your ex how many more we hold.

The image was a screenshot of a block explorer showing a single transaction from March 2023: her first Bitcoin movement, the proceeds of the first Hashcairn job, travelling from the wallet Mateo had set up for her to the consolidation wallet they had shared. An amount, a date, two addresses, a fee. Public data, technically. Every chain analysis firm in the world could have found it.

But she had never used that wallet anywhere near her name. The exchange account was in a jurisdiction that did not answer foreign requests quickly. The address had appeared in no leak she knew of. For someone to hand it back to her, attached to her, they had linked the unknowable to the undeniable: they had connected a pseudonymous address to Sofía Alvarez, and chosen a transaction intimate enough to prove it.

Not all of it. One transaction. The way you show a hostage-taker that you know where the house is by mailing back one photograph of the door.

She looked at the date again. March 2023. The week of the first conversion, the umbrella in the rain, Mateo's phone flat

on the table between their plates. He had proposed the route. She had experienced it as rescue. The notebook said so, in her own handwriting, and now a stranger's message said it too, in the grammar of leverage: *ask your ex.*

She understood the instruction perfectly. They wanted her to believe the map of her history lived in Mateo's head, so that every fear she felt would point at him, and every question she had would route through him, and the faction that owned him would own the channel to her.

It might even be true. That was the elegant cruelty of it. Some of what she was seeing was certainly Morrow Array's data work, clusters and heuristics and probabilistic matching run at scale against every Argentine wallet that moved in the crisis years. And some of it might simply be Mateo's memory, accurate as a knife drawer, doing what it always did.

She could not tell which. Neither could they, perhaps. Neither could he.

Sofía photographed the message, printed the screenshot, and filed it behind Martin's invoice in the kitchen drawer, building the file she hoped she would never need: evidence of who already knew what she had spent three years hiding.

Then she updated the timeline in the new notebook, one line, dated today:

My past is now a weapon that at least three people are aiming.

Chapter 9: Fork

Martin's public trail ended at a dead mirror.

She had spent Sunday afternoon following him through the commons the way you follow anyone through a city at night, by what stays lit. His NamedWitness commits had stopped in July, but his activity on a community forge had not: comment threads, review notes, a long argument about attestation formats that he had won on points. The forge was called La Forja Sur, a volunteer-run instance hosted, according to its footer, on donated hardware somewhere in Buenos Aires. On Thursday, the day her pods first certified the future, the mirror's availability page had gone grey. On Saturday night it had flickered through a maintenance page and a blank site at a new address. Since then it had returned nothing but connection timeouts.

The instance administrator's handle resolved to a real name in the way small volunteer infrastructure always eventually does, through a sponsorship page and an old conference talk and a photo of a man patching a network switch while holding a guitar case between his knees.

Agustin Varela.

Sofía sat back from the laptop and let the name have the room.

They had been together from 2016 to 2019, which meant he

knew her from before the inflation years, before Hashcairn, before she had become a person who kept two notebooks. The relationship had ended without betrayal and without a final conversation, just the slow arithmetic of two people whose lives were converging on different answers to the same question. She had been building redundancy into everything: savings, systems, exits. He had been building nothing at all, on purpose, living out of an instability he treated as a design choice rather than a defect. She had mistaken it for immaturity. She was no longer sure. That was the thing about Agustin: he was the one person from that decade who had kept every promise she ever watched him make, and none of them had been promises to stay.

She had avoided him since well before Mateo. Avoidance was easy; Buenos Aires was technically twelve million people arranged in practical clusters of two hundred.

The forge's status page listed its admin contact, and the admin contact's other project was the sound system at a club in Palermo called Cable Rojo, which posted its open mic lineup on Thursdays.

He was going to be ten minutes from her apartment tonight, singing.

Cable Rojo occupied the ground floor of an old printing house, narrow neon over the door, graffiti layered on the side wall like sediment, a bar in front and a live room behind where local bands played to people who owned their amplifiers. The open mic ran early Sundays. Sofía paid the cover, took a position near the back pillar with a beer she did not want, and spotted him immediately, because some things do not change: Agustin on a stage looked like a man standing exactly where his life had put him.

He was midway through *Livin' on a Prayer*.

Of course he was. Every open mic in every city on earth held one man singing that song, and in this one he was good at it, guitar tight against the backbeat, eyes shut on the high part, the crowd of regulars giving him the chorus the way crowds give choruses, as rent. Sofía stood at the pillar and watched her ex-boyfriend sing karaoke-adjacent rock with total professional commitment, and felt the strange vertigo of timelines crossing: the woman who used to wait for him after sets in another decade, holding two notebooks and a federal crime, waiting for him again.

She arrived too late to catch him before the set. There was no interrupting this without becoming the room's problem; the song had a contract with its audience, and she was not going to be the person who broke it. So she waited through the key change and the last chorus and the applause, and watched him see her.

It happened the way it happens in rooms like that: he was scanning the back of the room during the applause, the way performers do, checking the size of what they earned, and found her at the pillar, and went still for half a second before finishing the bow. He lost none of his stage composure. He thanked the crowd, handed the guitar to the next act with a cable-coiling ritual so practiced it looked like sleight of hand, and came over unhurried, wiping his hands on his jeans.

"Sofía Alvarez," he said. "In my bar."

"Your bar has a hole in the ceiling."

"The hole is load-bearing." He looked at her properly then, and whatever he saw made him skip the social part entirely, because Agustin had always been able to read the difference between a woman coming to say hello and a woman coming

to ask for something. “You didn’t come for the music.”

“I didn’t know you’d be playing. I need to talk to you about La Forja Sur.”

“Of course you do.” No bitterness in it, just recognition, and something else she had forgotten: patience. “Not here. Not over that noise.” He glanced at the stage, where the next act was tuning badly. “Give me twenty minutes. I have to hand over the desk, the mixer and a very temperamental compressor to Nacho, and if I abandon them mid-handover I will pay for it all month.”

“You’re doing a handover at your own open mic.”

“Everything is someone’s production,” Agustin said, “if you intend to be allowed back.”

The next performer was seventeen and had built his backing track on a phone. The application had separated drums from a record, changed the key and generated a bass line close enough to familiar that the room would accept it. He knew none of the signal chain beyond the phone’s volume control. Agustin did not object. He routed the output through a limiter, showed the boy which channel to mute if the application froze and made him repeat the instruction.

“You let generated music on your stage,” Sofía said when he returned to the desk.

“I let a kid play three songs. The stage isn’t a provenance court.”

“Your forge bans some generated reports.”

“One branch does. The other discloses them. That’s why it’s a fork.”

He pointed to the boy’s phone. “That tool got him into a room with an audience. Good. It also means Nacho and I inherit every failure the tool’s company never imagined in this

building. The kid gets access. We get maintenance. Also true."

During the second song the backing track jumped half a beat. The boy kept playing. Agustin muted the generated drums, signalled the room to clap time and brought the track back at the next phrase. Most of the audience never noticed. The intervention lasted four seconds and depended on fifteen years of rooms teaching him where a song could survive a cut.

"Did the phone make the performance less his?" Sofía asked afterwards.

"No. It made the failure partly mine because I agreed to put it through my system."

"You didn't review the application."

"I reviewed the boundary I control. Volume, channel, mute. If it starts insulting the audience in Mandarin, I can pull one cable." He coiled the spare lead. "People keep confusing understanding a whole tool with understanding where you can stop it. I don't understand half the firmware in this desk. I know which breaker makes it quiet."

That was not Ternhaven's named expert and not Mateo's green evaluator. It was smaller: a person close enough to consequence to interrupt it, and a room that knew his name if he failed.

"Is that why you keep old clusters?" she asked.

"I keep old clusters because people build useful things on free tiers, grants and enthusiasm, then the interesting developer leaves. Six months later a pharmacy or a union newsletter discovers the system still matters. Nobody budgets for the person who stays."

"And AI makes that worse."

"AI makes building arrive earlier. Maintenance arrives at the same time it always did: after somebody depends on the

thing. Sometimes the new builder learns. Sometimes they call me. Sometimes they vanish because the prompt worked and they think working is a permanent property." He shrugged. "I'm not against the tool. I'm against abandonment described as innovation."

She watched him do it from the bar while she paid for the beer she had not drunk. It was, she had to admit, its own kind of competence: cables labelled in handwriting, a checklist taped inside the desk lid, each item pointed at and confirmed aloud, Nacho nodding along, the compressor coaxed with two knobs and a threat. Nobody had ever run an incident call better. He finished, dusted his hands, collected a canvas bag that clinked, and walked her out into the night air, where the graffiti wall glowed under the neon and the winter-damp street smelled of fried onions from the parrilla two doors down.

"There's a bodegón on the corner that stays open late," he said. "I haven't eaten, and I'm not discussing a broken machine until I have."

The place was all fluorescent light and football on muted television, six tables, a waiter who greeted Agustin by name. Milanesa napolitana for two, he ordered, before she could open her mouth, plus a bottle of the cheap red that bodegones are legally required to serve in unlabeled bottles.

"Agustin."

"Eat first. Then tell me who died."

"Nobody died." She cut into the milanesa when it came, thin beef, ham, sauce, a slab of melted cheese over all of it, engineering rather than cuisine, and understood why he had ordered it: this food takes twenty minutes to eat no matter what you say. The table could not be cleared around her. There

would be no quick version of tonight.

So she told him. Not everything; she told him the shape. A colleague who had gone missing after finding something wrong in the systems they both cared about. A public archive, La Forja Sur among them, that had stopped answering the same week. Evidence that mattered, sitting on failing hardware, in the custody of an administrator whose name she had known since before any of it.

Agustin ate through most of it, listening the way he listened, which was completely and without performing it. When she ran down, he wiped his mouth and said:

"You've narrowed that confession until it sounds like a work ticket."

She opened her mouth to deny it and closed it again, because he was right, and because he had seen it in 2018: her habit of converting anything raw into a request with acceptance criteria. *Here is the problem, here is the scope, here is what I need.* Confession as service request. Intimacy filed under incident.

"Martin Vale," Agustin said. "That's the missing colleague. The NamedWitness man." He turned his glass by its base. "I don't know anything about any of it. You understand that? I maintain a mirror. People post arguments about software licences at me. Whatever Martin was into, it never touched the forge."

"His last public activity was on your instance. Then your mirror died the same week."

"My mirror died because it got flooded." He said it without heat, an engineer reporting facts. "Three months of generated issue reports, thousands of them, polished garbage, every one formatted beautifully. The storage filled, the search

index choked, and the volunteer who used to clean the queues gave up in February because he said it was like shovelling the sea. I've been meaning to rebuild it and I've been meaning to rebuild it." He looked at her, and she watched the decision happen behind his eyes, not quickly, the way his decisions always went, all the way down to foundations before anything moved. "But the data might still be there. Storage dies slower than websites do."

"You'll look?"

"I'll preserve it. Tonight, tomorrow, whenever Nacho doesn't need me." He pointed the fork at her, gently. "And Sofía, I'll do it because that archive is mine to keep. It's the only reason I do any of this. Somebody has to remain after everyone interesting leaves. But I'm not your incident responder, and I'm not getting pulled into whatever this is past the edge of my own machine. One look. One report. That's the whole ticket."

"That's all I'm asking for."

"No," Agustin said, signing the bill without looking at it, "it isn't. But it's all I'm granting."

She paid anyway, over his objection, and tapped her card on the terminal with a small grim satisfaction she did not explain to him. Let the record show that on Sunday night she bought dinner in Palermo with her own frozen-and-unfrozen personal card, in full view of whatever was watching, one honest location record in a week that was filling up with dishonest ones.

Outside, the neon hummed and the night had softened. They stood on the corner for a moment in the old geometry, both knowing the moment, neither feeding it.

"He's involved, isn't he," Agustin said. Not a question.

"Whoever's missing you won't name. The one who taught you the money routes. Your Mateo."

Sofía said nothing.

Her pause answered him, and they both heard it, and Agustin nodded slowly, putting his bag over his shoulder like a man who had just learned the price of the favour he had already agreed to do.

"Careful," he said. "You always were worst at the things you were best at."

Chapter 10: Read-Only

The rehearsal room sat behind the club, up a staircase that smelled of solder and old beer, and it held, among amplifiers and a drum kit in a case and posters for nights nobody would remember, a computer rack.

Not a server room. A rack: five machines of different vintages on wooden shelves, cable-tied into stability, a consumer router, an uninterruptible power supply with its battery replaced so recently the sticker was still on. La Forja Sur, in the flesh. The community forge ran here because Agustin had bartered hosting against sound engineering, which meant the archive lived above a rock club, cooled by a fan that had opinions.

"Three nodes run the cluster," Agustin said, kneeling at the shelf. "This one is storage. Or it was." He laid the back of his hand against the case, the same gesture Lucia Barrenechea would have recognized a thousand kilometres southwest. "It's warm, which means it's alive, or it means it's dying loudly."

"You didn't check it since Thursday?"

"I checked that it pinged." He pulled the machine out with both hands, cradling it like the drum case. "That's the honest confession of every volunteer admin alive. You monitor what you have time to mourn."

They put it on the workbench under the good lamp. He opened the case while she fetched the screwdrivers he named without looking up, and inside, the smell of hot electronics rose off two of the four drives like a smell of burnt toast from a kitchen where something had already happened.

"Two drives down, same pool," he said. "RAID protects you from one failure. Nothing protects you from one failure plus neglect." He connected the drives one at a time to a recovery dock, listening to each spin-up with his head tilted like a doctor with a stethoscope. The first drive chattered, caught, and presented a file system. The second made a sound like a card in bicycle spokes and gave up.

"Pool's degraded but mounted," he said. "We get one pass at this, read-only, no repairs, no cleverness. Copy first, look second. Where's your external?"

She had brought two, because she was who she was.

While the first image crawled across at USB speed, Agustin walked her through what had actually happened to the mirror, and it was a story she recognized from her own week wearing different clothes. In February, La Forja Sur had appeared on some list somewhere, and the generated issue reports had arrived: hundreds a day, then thousands, each one grammatical, formatted, confident, and useless. The volunteer triager quit. Queues filled. And underneath, the storage pool crept towards full, because every polished nothing still occupied real blocks.

"The site didn't get hacked," Agustin said. "It got loved to death by machines. Storage hit ninety-nine per cent Thursday morning, the database froze mid-write rather than corrupt anything, God praise its little rules, and the whole thing fell over looking exactly like an attack if you only glance at it." He

glanced at her. “Which is why you’re really here. Your missing man’s last messages are in this thing, and this week everyone wants it to have died dramatically.”

“Would you have looked without me?”

“No. I’d have rebuilt it empty next month and hated myself quietly forever.” The copy progress bar moved. “There. Now we look properly.”

The first image failed verification at eighty-two per cent.

Not dramatically. No alarm, no red screen, only a checksum mismatch in one block range and a line from the recovery tool saying the source had returned different bytes on its second read. Agustin stopped the copy before Sofía finished reading.

“The drive is changing underneath us,” he said. “We don’t get to call the first image evidence.”

“Can you stabilize it?”

“I can cool it, change the dock and ask once more. Stabilize is a word vendors use when they want you to stop imagining entropy.”

He labelled the failed image *incomplete, do not rely*, including the time and tool version, then set the drive on an aluminium plate in front of the rehearsal-room fan. Sofía watched him preserve the failed attempt instead of deleting it.

“That stays?”

“Of course. If the second image differs, the failure tells us where to be suspicious. Bad evidence can still describe its own limit.”

It was exactly the kind of sentence she trusted when it came from a machine and resisted when it came from a person.

They waited twenty minutes for the temperature to fall. From the club below came the scrape of furniture and one last burst of laughter from the staff closing the bar. Agustin

made mate with water from an electric kettle whose switch had been repaired with a screw.

"You still cool every problem before touching it," he said.

"You still keep broken kettles."

"This kettle has a maintainer. That's different."

He handed her the cup. When they had been together, Sofía had treated his rooms as temporary arrangements waiting for adulthood: borrowed rehearsal space, mismatched servers, invoices that arrived in clusters. She had read instability as a failure to plan. The rack in front of her had run a public archive for seven years on money nobody had promised twice. It was not stable. It was maintained, which was a more expensive state and one she had not known how to value then.

"I was unfair about this work," she said.

Agustin looked at the cooling drive rather than her. "You were accurate about the income."

"That isn't the same thing."

"No. It isn't."

He did not use the opening to inventory the relationship. He changed the dock, connected a hardware write blocker and began the second pass at half speed. This time the suspect range read consistently. The resulting image matched a third pass over the metadata and event-log blocks. Agustin wrote both results on paper.

"Now we have something," he said. "Not because the screen says complete. Because we know which question the failing drive answered twice."

The surviving persistent volume held the forum data: users, threads and the append-only event log of everything the application had ever done. Agustin gave her the events and kept the disks, an easy division of labour that they fell into without dis-

cussing, because it matched their shapes. He read hardware. She read history.

She reconstructed the chronology outward from Thursday's crash, and within an hour had the answer to the question she had carried across town.

Martin's account had logged in on Wednesday at 21:41. He had read a thread. At 22:03, the thread vanished from the index. Not deleted in any way the application admitted to: no deletion event, no moderator action, no audit trace. The discussion simply stopped being listed, and its direct URL started returning not-found, while the underlying posts sat untouched in storage the whole time.

"Removed at the application layer," Sofía said slowly, "after the mirror had already stored it. Someone with application access hid a thread without using any feature that admits hiding things."

"So not clock skew," Agustin said dryly, "and not my dead drives. Somebody walked into the house without breaking the lock." He did not ask how that was possible. He just wrote *app-layer compromise* on a sticky note and stuck it to the monitor, because some facts you file before you feel them.

The thread itself was recoverable from the raw store, and she read it twice while Agustin pretended to be busy labelling cables.

It was Martin at his best and worst. The subject was a fork war in a free-software project that maintained a dependency scanner. One branch of the community had adopted a hard rule: no AI-origin reports accepted, full stop, protect the commons, protect maintainer attention. The other branch held that tools were tools: assistance allowed, disclosed, reviewed, signed by a human who understood it. The argument had run

for months, civil by forge standards, which is to say there were survivors.

Into it, ten days before he disappeared, Martin had posted a technical observation that stopped the argument cold. A zero-day claim currently being traded, he said, in a market he did not name, had appeared on both sides of the fork. On the no-AI branch it carried one authorship trail. On the disclosure branch it carried a different one. Same claim, same proof-of-concept structure, two histories, and the difference between them was worth, he suspected, real money to whoever was brokering it. Somewhere between the branches, the claim had changed parents.

Authorship is supposed to be the one thing a fork cannot lose, he wrote. *You can fork code and both copies stay true. Fork a fact's provenance and at least one copy is a lie. I am going to find out which.*

A week later, at 22:03 on a Wednesday, the thread was hidden. Six hours after that, her pods certified the impossible receipt that woke her.

"There's your missing discussion," Agustin said quietly, reading over her shoulder, because of course he had read it too; keeping archives makes curious people. "And there's why someone reached into my machine to bury it." He straightened up. "One problem. This thread references a dependency: the scanner both branches use for report triage. It's mentioned by name eleven times as the thing that got flooded and broke." He pulled up the package page on his phone. "Know who maintains the biggest deployment of that scanner in this city? The delivery co-op girl. Micaela. My guys patched her instance in February when the rule change melted it. Same component, same generated core nobody can

explain. It's the hinge both sides of this fork swing on, and it lives in a shop tablet in Balvanera."

The chain assembled itself in Sofía's head with an almost audible click. The flood that killed the mirror and the patch that saved Micaela's business were the same component wearing two fates. If she was right, Ternhaven's people wanted Martin's thread buried, and Morrow Array's people wanted the claim's second parentage never traced. And sitting underneath both, holding the whole structure an inch above the ground, was a piece of software whose own author could not explain it.

"Call her," Sofía said.

Agustin checked the time. "It's one in the morning."

"Her dispatch floor runs until two on Sundays. She told us that yesterday."

He made the call from his own phone and put it on speaker only after Micaela agreed. Behind her voice came motorbikes and the double ring of the shop door.

"The February backup," Agustin said. "Do you still have it?"

"On the workshop drive, unless somebody cleaned it. Why?"

"The generated component in your compliance tool shares a package with the scanner that drowned our forge. I need permission to compare the copy we made with the public package history. Read-only. No customer data."

Micaela was quiet.

"You said the repair was done," she said.

"It was. This is not a repair."

"Then what am I agreeing to?"

It was the right question and neither engineer answered

quickly enough.

Sofía moved closer to the phone. “We’re trying to establish when that component entered your tool and which parts you changed afterwards. Not whether you wrote it. Not whether using it was wrong. Only the history.”

“And if the history is bad?”

“It stays true.”

Micaela laughed once, without humour. “That’s a person-with-salary answer. If the history is bad, twelve riders don’t get paid on Tuesday.”

“Then say no.”

The offer stopped her. People had been calling Micaela raw material all week, even when they praised her. Raw material did not get a refusal.

“Read-only,” she said. “Agustin keeps the copy. You send me what you conclude before you send it anywhere else. And if you don’t understand something, you write that you don’t understand it. Don’t turn guessing into my history.”

“Agreed,” Sofía said.

“One more thing. That component wasn’t all rubbish. It kept invoice matching alive through the March rule change. I know nobody likes hearing that after it breaks. It still did.”

“We’ll write that too.”

Micaela hung up to release a rider whose phone had died. Agustin wrote her conditions on a label and stuck it to the backup drive before touching anything else.

Agustin unplugged the recovery dock and squared the drives on the bench like tools after a job.

“Here’s my limit, and then I have to catch the last bus,” he said. “I’ll keep this image safe. Cold copy, offline, two places. And I’ll do one comparison for you when you need it, properly,

with time to do it right: whatever timeline you build, I'll check it against the physical record. Once. After that, I'm the guy who keeps a mirror, nothing else." He looked at her, and asked nothing about Mateo, nothing about the money he could smell behind all of it, nothing about why her hands were not steady on the screwdriver tray. "You used to leave rooms without saying goodbye. That's the only thing I ever held against you. Say goodbye tonight."

"Thank you for the mirror."

"That's not a goodbye."

"Goodbye, Agustin." It came out steadier than she expected. "Thank you for keeping things."

He nodded once, released her from eye contact with visible mercy, and turned back to his rack.

On the workbench the recovered volume sat mounted read-only, its contents now copied to two drives, one of which went into her bag and one into his fire safe. An archive that had been loved to death by machines had given up one true sentence before dying: a fact can be forked, and somebody had paid to hide which copy lied.

Outside, the club had emptied. The neon over Cable Rojo buzzed and flickered, holding its colour the way the drives held their data: imperfectly, warmly, against all advice.

Chapter 11: Assisted By

On Monday she went back to the fork.

Martin's recovered thread gave her the map. The territory was two issue trackers, public, mirrored, one for each branch of the scanner project since the community split. Somewhere between them, a claim worth real money had changed parents. She booked a meeting room nobody wanted, put the two histories side by side on the largest screen she could find, and started reading the way she read clocks: for disagreement.

The claim itself stayed sealed behind the usual doors, and she did not try the doors. What travelled in the open was the paperwork. Reports, reproductions, maintainer correspondence, credit lines. Provenance leaves records even when exploits do not.

On the no-AI branch, the flaw had been filed by one researcher with eleven years of history, a distinctive prose style and the small inconsistencies that living writers carry: version numbers remembered wrong once and corrected later, a hypothesis abandoned halfway through and replaced by a better one. A human trail. Messy in exactly the way truth is messy.

On the disclosure branch, the same flaw wore different clothes. Its report had been amended twice, and the amendments carried fresh names: researchers she half knew from

conference programmes and bounty leaderboards, five of them in total across the record, each credited with confirming the finding under disclosed assistance, each with a plausible public face.

She diffed the confirmation texts, and the room got colder.

All five confirmations described the trigger condition the same way, and all five described it wrongly. Each stated that the parser failed open when a specific legacy flag was set, and only then. Anyone who had actually run the working proof-of-concept would have found the flag irrelevant; the real path went through the deserializer's fallback branch, which the flag merely made louder. It was the kind of mistake a reader makes from a summary. It was not the kind of mistake a person makes after reproducing a thing with their own hands.

And it was the same mistake five times. Identical in wording, down to the bracketed reproduction counts and the same odd habit of calling the legacy flag *the old switch*. Independent humans diverge. That is what independence means. Five people making the same mistake is one author holding five pens.

She photographed the diff, filed it, and sent the five handles to the dead bug-bounty thread, because she had promised herself she would stop routing questions through Mateo and had already broken the promise.

His reply came in nine minutes.

All five reproduced it. Signed confirmations, timestamps, their own environments. Every claim in that queue runs green before it ships. You of all people should respect that. Judge the result.

Who wrote the result, she sent back.

The result is the result, he wrote. *Reproduction is the only priesthood I recognize.*

But reproduction, she thought, was not the same as under-

standing, and the public record agreed with her. Eight months ago, a branch maintainer had pressed two of the five credited researchers in an open thread, politely, asking each to walk through the decisive step. Both had eventually replied, from different countries, six weeks apart, and their answers matched almost word for word: the flaw was load-dependent and best demonstrated under sustained traffic on affected versions, which was a sentence shaped like an explanation and contained none. Neither mentioned the fallback branch. One of them had then stopped answering. The other thanked everyone for a great discussion.

She wrote one line in the notebook: *Reproduced is not the same as owned.* Underneath it, because honesty had a cost she was trying to stop deferring, she added: *Ask me about midnight cleanup.* Then she closed the notebook before the sentence could grow friends.

At half past nine that night she took the incident file home and spread it across the kitchen table. Four receipts from her pods, printed Friday morning in the office because printers were the one system nobody compromised on purpose. Compact, signed, boring. She reread them line by line, looking for anything she had missed while the incident channel owned her attention, and stopped at the attestation clause.

The witness attests that the environment named herein remained sealed for the stated interval, and that the recorded output was reproduced therein. This receipt attests the interval, not the outcome.

She knew the sentence. Not ones like it. That one.

The kitchen table in 2023 had been smaller, in the apartment she had shared with Mateo, and the pizza box on it had been balancing on the second notebook, which was already becoming what it was. Their first paid verification job had arrived

through a broker neither of them ever named: a client who suspected a rival lab of faking reproductions and would pay for proof, sealed and witnessed, that a claimed result could be regenerated in a clean environment. Mateo had drafted the engagement letter in an evening, full of confident verbs. The witness guarantees. The witness certifies. The witness warrants the integrity of the finding.

The technical work had taken longer. In those years assistance still arrived as fragments: a completion inside the editor, a function in a chat window that somebody copied into the repository, an explanation you distrusted until the test agreed. Mateo asked a model to write the reconciliation tool that compared the sealed environment with the client's manifest. It produced something plausible in forty seconds and wrong in three ordinary ways. It sorted version numbers as text, treated missing fields as empty ones and assumed every clock included a zone.

They fixed it together at the table. Mateo supplied examples. Sofía wrote the acceptance cases. Each correction went back through the chat and returned as a new block they reviewed line by line before pasting. By two in the morning the tool had reduced six thousand manifest entries to eleven disagreements, ten of which were harmless. The eleventh was the client's whole case.

Without the assistant, they would have spent two days writing glue and billed one. With it, they finished before breakfast and understood every line that survived. Sofía remembered the relief more clearly than the caution. The machine had not acted like an author or an employee. It had acted like a fast junior who forgot everything between questions and never minded being corrected. She had thought: *this is what it is for.*

Three years later Mateo's agents read whole repositories, changed several files, ran their own tests and retried until an evaluator turned green. The human glue work had disappeared. So had the long evening in which two people noticed what the tool assumed.

"You're promising things we can't deliver," she had said, reading it with a pen. "We can't warrant the finding. We've never seen the finding. We can warrant one thing only: that the environment stayed shut and the output came out of it during a window we can defend."

"So the receipt says nothing?"

"The receipt says exactly enough." She had crossed out his sentences one at a time, feeling the strange pleasure of it, subtraction as craftsmanship. "It attests the interval, not the outcome. If anyone ever asks us what we verified, the honest answer is on the paper. Nobody can pressure us into signing more than we know, because the language won't hold it."

He had looked at the narrowed clause for a long moment, then smiled in the way he did when someone handed him money. "You just invented a product," he said. And in a sense she had. Hashcairn's clients paid, then brokers paid, then a clearinghouse in Patagonia bought the process wholesale, right down to the wording, and neither of them had thought about it in years.

Sofía sat in her own kitchen with the printout flat under the lamp and felt the reinterpretation move through her like weather. She had told herself the old story for three years: that she had operated Mateo's system, signed what he built, been the careful half of someone else's ambition. The paper said otherwise. The grammar every witness receipt in that market spoke, the exact hinge that let a human name attach itself hon-

estly to output it never understood, was a sentence she had written to protect herself at thirty. She had built the narrowest possible container for responsibility, and the market had industrialized it. Morrow Array added authors the way she had once added clauses: precisely, defensibly, each addition small enough to survive being read alone.

She had thought she was writing a shield. She had also written the stencil.

Micaela called before Sofía could close the Hashcairn archive.

"Mateo sent me work," she said. "Actual paid work. I need you to tell me whether the agreement is normal."

The contributor page offered eighteen dollars per accepted evaluation. Each task presented a synthetic failure from the dispatch twin, a proposed correction and a small rubric: resolved, unresolved, introduced another error, cannot determine. Payment arrived only when Morrow Array's evaluator accepted her result.

Micaela could do that work. Not security research, not code review. She knew whether a route duplicated payment, whether an invoice category stranded a rider and whether a proposed fix produced an operation she could actually run. The queue valued the knowledge everyone in the workshop had treated as context around the technical problem.

"They noticed me," she said, and the pride in it made Sofía careful.

The terms ran six pages. Assistance disclosed. Results aggregated. Contributor identity may accompany accepted outputs for custody and quality purposes. No transfer of copyright in the contributor's pre-existing business data. The language was not fraudulent. It was broad in exactly the places

future uses needed space.

"What does *accompany* mean?" Sofía asked.

"That my name shows I tested it."

"Tested what? Your dispatch result, the proposed fix or anything later built from the evaluation?"

"The task in front of me."

"The agreement doesn't say only that."

Micaela went quiet. In the background the shop shutter rattled and someone asked for change.

"Do you think I shouldn't do it?"

Sofía looked at the eighteen-dollar rate. One accepted task paid nearly as much as Micaela made on several deliveries after rider costs. Refusing on her behalf would be its own kind of gatekeeping, an expert protecting someone from a market by keeping her outside it.

"I think you should make them answer three questions in writing. What exact object will carry your name? Can an evaluation be reused outside the task you saw? Can you withdraw your name later without deleting the technical result?"

"And if they don't answer?"

"Then you decide what the silence costs."

"That's a person-with-salary answer again."

"Yes," Sofía said. "It is."

Micaela put the question to Ariel while Sofía remained on the line. He had returned from a clinic run and was reconciling the paper job. He wanted to know whether evaluation time came out of dispatch hours and whether riders whose failures became test cases received anything.

The agreement said contributors must have rights to submitted data. It said nothing about paying the people whose work generated the failures.

“The failures belong to the business,” Micaela said.

“The waiting belonged to me,” Ariel answered.

They settled on a local rule Morrow Array had not requested: evaluation work would happen after shift reconciliation, and if a rider’s disputed job became a paid test case, half the first payment went to that rider. It was crude and difficult to audit. It was also the first compensation rule in the chain written by people who had produced the evidence.

Morrow Array support answered one of Sofía’s three questions. The contributor’s name would accompany accepted evaluation records. Reuse and withdrawal were referred to the terms they had already read.

Micaela enrolled the tablet.

“I’m doing five,” she said. “Then I stop and see whether they pay.”

One worked when she expected it to fail. The task found a duplicate reimbursement created when a rider’s phone reconnected after manual assignment. Micaela reproduced it twice and marked *resolved*. Morrow Array accepted the evaluation in eleven seconds.

The screen credited **M. Ferreyra** and displayed a balance.

“It found money we were losing,” Micaela said. “That part is real.”

“Write down what you tested,” Sofía said.

“I just did. In their box.”

“Write it somewhere they don’t own.”

Micaela sighed, but Sofía heard paper move.

Her phone buzzed against the table.

Aster Relay identity service. Routine notification, the kind she had configured herself, the kind that usually caught someone enrolling a tablet for the on-call rota.

A new device has been attested to your profile.

She opened the entry. A laptop, macOS, hardware fingerprint freshly minted, hostname `sofia-alvarez-mbp`, one character different from her actual machine's name. Enrolled Sunday evening at 21:47, authenticated cleanly against the corporate identity provider, granted trusted-device status. No failed attempts preceding it. No alarm raised anywhere, because the enrolment had used credentials that were, as far as the directory knew, hers, presented by a machine whose attestation was valid, at a time when she had been standing at the back of Cable Rojo watching a man she used to love finish his open-mic set.

The entry also showed how it had got past the hardware factor, the part she looked for first. It hadn't. At 21:31 a helpdesk ticket in her name had reported a lost security key, and the recovery flow had issued a one-time enrolment code after a callback to a phone number the directory also believed was hers. The code let a new machine register and bind a key of its own. The hostname was only a name the machine had given itself; attestation vouched for the hardware, not for what it called itself.

Not stolen, she understood, reading it twice. Assembled. Someone was building a Sofía out of true parts, a device that had genuinely passed attestation, a profile that had genuinely been trusted, a woman who existed in every record except the one that mattered: the chair she had been sitting in.

She ran the revocation procedure with steady hands. Sessions killed, password rotated, hardware token cycled, ticket filed to the identity team with the facts and none of the theories. The screens confirmed each step in green.

The attestation stayed.

So did what it had done. Its actions all fell inside its first nine minutes of trusted status, 21:47 to 21:56. After that it had simply sat there, trusted and quiet, for most of a day.

The identity team found them in the session ledger after Sofía asked not for a summary but for every authorization decision tied to the device. At 21:51 it had opened Aster Relay's internal customer-exception directory. At 21:52 it requested the index entry for Talud's account. The document contents were access-controlled and the request was denied. The index metadata was not: sponsor name, review date, retention class and the fact that Daniel Cho's approval existed.

At 21:54 the device exported its own access log through the employee privacy tool, a feature designed to let workers see what the company recorded about them. The export included the denial and therefore proved that a device bearing Sofía's identity had sought Talud records.

"Can you invalidate the export?" she asked the identity engineer on the call.

"We can annotate it as associated with a compromised session."

"Can you remove my name?"

"It was your profile at the time. Removing the name would alter the audit event."

Correct answer. Unbearable answer.

She asked him to preserve the raw session and sign the compromise annotation with his own operator identity. He did. His name was Felipe Ramos. Until that moment he had been a voice on a weekend escalation, one more person tempted to make the alert go away. Once named, he read the event again and noticed the privacy export.

"If you hadn't asked for individual actions, we'd have

closed this as successful revocation," he said.

"It was successful. Forward."

"Right. Forward."

They both sat with the word. Security systems were good at stopping a key from opening tomorrow's door. They were less capable of admitting that yesterday's door had already opened onto a corridor of true records.

Revocation worked forward, never backward. The device could be untrusted from this minute on, but the record of its enrolment was a historical fact now, filed and timestamped, one true entry in the growing archive of a woman who had never sat in that chair. You could revoke a device. You could not revoke having trusted it.

She turned the laptop screen towards the dark window, where her own reflection sat at the kitchen table with the incident file, and for the first time that week she could not immediately say which of them the records described.

Chapter 12: Inspeximus

Noa Vermeulen kept two rules about Buenos Aires meetings: never the same hotel twice, and never before eleven, because the city did not believe in mornings and pretending otherwise made people honest at the wrong moments.

She chose a café on the quiet side of Recoleta, deep enough from the window that a phone across the street would capture table shapes rather than faces, and arrived twenty minutes early to watch Sofía cross the square. The engineer walked like her timelines, Noa thought. Straight lines, checked corners, no wasted acceleration.

It was a little after eleven on Monday. That morning's report from the Buenos Aires counsel had been four pages long. The engineer had traced Morrow Array's laundering in public records alone: five credited names, one inherited error. Noa had read the summary twice, once as intelligence and once, unwillingly, as admiration. Then she had cleared her morning.

Sofía sat, declined coffee, and placed her phone face down on the table, which Noa noted was either courtesy or theatre.

"You found the five names," Noa said. "I will not waste your time asking how."

"Your turn," Sofía said. "On Friday you sold me custody.

Named humans who understand what they sign. On Sunday night I found Martin Vale's thread hidden inside an archive no machine had any business entering. So before we talk about anything else: does Ternhaven run models or not?"

A fair question, asked without heat, which made it harder. Noa turned her cup a quarter turn on its saucer, an old habit she had stopped apologizing for.

"Yes," she said. "We run one. Its name is Inspeximus, and you will understand Ternhaven badly if you leave here thinking that word is a contradiction. May I show you?"

She opened her laptop far enough to share, not far enough to surrender it. Inspeximus's interface was plain to the point of austerity: queues, confidence scores, a column of provenance classifications. Noa walked Sofía through it the way she would walk a colleague through a radar display, because some of it deserved the comparison.

When Inspeximus began, Noa had read every hostile case it generated. That was two years ago, when a case arrived as a paragraph and a test condition and the day's work fit inside the day. Then model-originated submissions multiplied, Inspeximus's operators added autonomous retries and the cases became families whose members changed as rival systems adapted. Noa now read the high-confidence exceptions and a weekly sample. She could explain the sampling policy, the appeal path and the last twelve failures. She could not honestly claim to have seen the whole instrument she continued to call subordinate.

Nobody could. That fact frightened her less than the available alternatives, which was how most professional beliefs survived acceleration.

A case entered the queue while they watched. Noa had not

arranged it; she disliked demonstrations because systems became theatrical around people who wanted to be convinced. Inspeximus marked the submission as likely generated, confidence ninety-four per cent, and unfolded the reasons underneath: uniform naming, compressed discovery interval, similarity to three dead-end families Ternhaven had seeded the month before.

"What happens now?" Sofía asked.

"At that confidence, the claim is held from settlement and an analyst receives the hostile cases."

The analyst's initials appeared in the assignment column. YK. Noa knew him: Yannick Koren, fifty-eight, reverse engineer, one of Ternhaven's expensive human names. He had been looking at machine code since before half the operators were born. His queue showed fourteen other holds.

Inspeximus generated six tests. Four failed immediately. The fifth made the submitted claim fail. The sixth reproduced it by a different path.

The confidence score fell to eighty-one, then climbed to eighty-eight as the system classified the successful reproduction as likely contamination from the claimant's own harness.

"It explained away the evidence against its classification," Sofía said.

"It updated on evidence about the harness."

"Did anyone ask it to test the explanation?"

Noa opened the analyst view. The interface offered Yannick two large actions: confirm hold, release claim. Below them, in small type, was *request independent rebuild*. That action required an unallocated environment and would miss the day's pricing window. Noa had argued for its existence eighteen

months ago. She could not remember the last time she had watched anyone use it.

Yannick confirmed the hold.

Elapsed review time: three minutes, twelve seconds.

“Named person,” Sofía said.

Noa sent him a message before answering: *Why not independent rebuild?* The reply came with the speed of a man who had already moved to the next case.

One success against five failures. Harness contamination is most likely. Fourteen waiting. Escalate if claimant appeals.

Noa showed her.

“He understands the decision,” she said.

“He understands the queue. That may not be the same thing.”

The distinction landed because Noa had used it herself, privately, when weekly volume first exceeded the analysts’ available days. Ternhaven had not replaced experts with a model. It had placed experts downstream of a model that controlled which questions arrived large, which arrived small and which arrived already answered. Human custody remained visible. Nobody had decided to hand the questions to the machine. It had happened one default at a time.

Noa requested the independent rebuild under her own authority. The interface asked for a reason. She wrote *successful hostile reproduction not independently explained* and accepted the warning that the delay might expose Ternhaven to price movement.

“Would you have done that if I weren’t here?” Sofía asked.

Noa considered lying and found no strategic value in it.

“Not today,” she said. “Possibly on Friday, in the sample.”

“After it has settled.”

"Yes."

Somewhere outside the café a bus exhaled at the curb. Inspeximus moved the case into a slower column and pulled the next one forward. Yannick's queue remained fourteen. The act of taking one question seriously had not created more of his time.

"Inspeximus reads the market the way your pods read environments. It fingerprints output that is likely model-generated. Style alone proves nothing, so it does not stop there. It generates hostile cases against every claim in circulation. Real claims survive hostile cases. Manufactured ones tend to die in predictable places, because a model that invented its finding cannot repair its own reasoning when the case breaks it." She scrolled. "And it drafts dead ends. Plausible research directions that lead nowhere, fed back into channels Morrow Array's agents are known to crawl. A weapon aimed at automation, not at people. That is the distinction, and I hold it precisely. A tool that challenges a human expert may be used by the expert. An expert of record must be a person. Inspeximus is an instrument. Nothing it produces carries our name until a person understands it and signs."

"Instrument," Sofía repeated. "It classifies. It fabricates bait. It decides which findings live. At which point in the pipeline does the instrument's judgment get read by a human who could disagree with it?"

"The classification thresholds are set by people."

"That is not reading the judgment. That is signing it in advance."

Noa had heard the objection before, from better defenders than this engineer, and had answered it the same way every

time, because the answer happened also to be true. “Every instrument in this market makes judgments. Your cache decides which packets matter. Murmur decides which flaws matter. The question that separates decent operations from corrupt ones is whether a named person can be held responsible for what the instrument does. At Ternhaven, yes. Always. You have met our paperwork.”

“I’ve met your lunch,” Sofía said dryly.

There it was, and earlier than Noa expected. She did not look away.

“Your corporate card bought a meal it did not eat,” Noa said. “I know. I have complained about it internally with more heat than I will show you, and I will tell you what I told them: manufacturing presence beside my name is a technique I associate with the other side, and someone on ours has decided you are worth the technique. I did not order it. I am not certain who did. Both halves of that sentence should frighten you, and I will not insult you by pretending they comfort me.”

Noa’s secure phone vibrated once inside her bag. She ignored it until the pattern repeated: urgent operational notice, acknowledgement required. She disliked looking away from a person she was asking to trust her, but the notice concerned the reason she had chosen this café.

Witness Four transferred. Madrid protocol active. Family exposure unchanged. Subject requests independent contact. Denied pending movement review.

Martin Vale was alive. Sofía did not know that yet.

Noa had authorized the transfer after Martin sent Ternhaven three screenshots from his daughter’s school account and asked whether their protective channel was still real. The screenshots showed no threat. They showed access: atten-

dance, pickup contacts, the title of a homework assignment. Morrow Array's message was that it could stand close to the child without touching her.

Ternhaven offered a car, a hotel and counsel. Martin entered the car voluntarily. At the first hotel he asked to leave and was told the route remained exposed. At the second he asked what evidence would close the exposure and received no answer. The protective protocol had no exit condition because nobody had designed it for a protected person whose information was also inventory.

Noa typed: *Permit independent counsel contact. Twenty minutes. Record only with his consent.*

The response came immediately: *Movement authority declines. Settlement proximity.*

Movement authority was a Ternhaven partner whose name appeared on no org chart. Noa could overrule him and create a custody dispute inside her own faction, or accept that Monday's ceremony justified keeping a willing witness behind a locked door. She had built her career around the proposition that dangerous evidence needed a named human custodian. She had not asked what happened when the custodian wanted to go home.

She escalated the request to Ternhaven counsel with her own name attached. That would not open the door. It would create a record that she had seen it closed.

"Something happened," Sofía said.

Noa put the phone away. "Something is always happening. The question is which part I can tell you without spending someone else's safety."

"Is Martin alive?"

The directness caught her. Noa could deny knowledge and

preserve the operation. She could confirm life and reveal that Ternhaven controlled access to it. Either answer would become leverage.

"I have no report of his death," she said.

Sofía's expression hardened. A technically true answer often advertised the larger truth it had been cut to avoid.

"That isn't what I asked."

"No. It is what I can sign."

For the first time Noa heard her own doctrine as a locked room.

Sofía studied her for a moment, recalculating. Noa let her. Trust built on shared enemies was still trust, and the engineer needed somewhere to stand.

"Show me the harm you claim to prevent," Sofía said instead. "Not the theory. The bodies."

So Noa closed the laptop halfway and gave her three, from files already sanitized, because she had chosen them before the meeting. A maintainer of a mapping library who received four hundred generated reports in a season and missed, inside the flood, the one handwritten report that mattered; he had announced his resignation in a commit message. A duplicate-claim war in which eleven brokers sold the same finding under different names until buyers stopped believing anyone. And the false positive: a buyer who paid, on Inspeximus's early advice, for a claim that did not work, then burned a source who had told him so.

"Automated volume is not a future risk," Noa said. "It is last year's ledger. That is why Ternhaven exists. Someone must price responsibility back into the market before the market drowns in green checkmarks."

"And the flaw your people labelled derivative in March,"

Sofía said. “The dependency parser. Five months unpatched while your label priced it into a scheduling problem. My ex showed me the changelog. Who signed that label?”

Noa had known the question was coming since the changelog went public. She gave it the silence it had earned.

“It worked,” she said finally. “The finding was real, Murmur produced it, and our classification buried it for five months because burying it protected the price of a human-origin package that was settling the same week. A person signed the label. I have read their reasoning and it was reasoning, not malice: the package’s buyers were owed first position on anything in that family. The vendor patched late because of us. That one is on our ledger, and I will not dress it as anything else.”

“Do you believe your own distinction?” Sofía asked. “Instrument, not author? Or is it commercially convenient?”

The question deserved honesty, and honesty had a floor. Noa looked at the provenance column still glowing on her screen, at the classification that had once, years ago in another life, attached itself to a young analyst’s careful handwritten work because the analyst had made the mistake of being efficient in ways Inspeximus associated with machines. There had been an appeal. There had been a phone call Noa still thought about at odd hours. The analyst had left the industry, and Noa had stayed, and the difference between those two facts was the floor she did not show anyone.

“I believe it the way people believe things that cost them something,” she said. “Which is the only belief worth selling.”

She paid cash, both meals, visibly, and left the notes on the tray where the terminal could see them.

“One more thing,” she said, standing. “Your five names.

When you show them to the world, and you will, show the error they share, not just the names. Names can be defended as coincidence. A shared mistake cannot. You learned that from the fork thread, so consider it a gift from someone who reads the same archives you do.”

She walked back across the square with her laptop bag over her shoulder, aware of the engineer watching her go, aware of a man at the kiosk who had been reading the same page of a newspaper for forty minutes, and no longer certain, which was new, whether the watchers around Sofía Alvarez were all working for people she could name.

Chapter 13: Murmur

The second message came through the same dead forum thread at noon: *Almagro, six o'clock. Bring questions you actually want answered.*

Mateo arrived early because the workshop taught him things his own rooms never did. At Morrow Array's rented compute everything was provisioned by ticket and nobody had ever held a soldering iron to anything. Here, a man was reflowing a laptop board under a magnifying lamp while arguing about football with the stereo woman, and the argument mattered exactly as much as the soldering. He had built a career on insisting that this kind of maintenance was nostalgia. He kept coming back anyway, which was data he declined to collect.

Sofía arrived at six precisely and did not smile at him, which was fair.

"I'll show you the harness," he said. "Not the production queue. The safe twin, the one we show auditors. You'll be able to see everything except the targets."

"That's a generous sentence," she said, "given what I saw your five names sign."

"They reproduced it," Mateo said, and heard how ready the sentence was, how it left him before thought. "Every claim

runs green before it ships. Judge the result."

"You said that already."

"It stays true."

He set up the harness view on his laptop at the back table, angled as always, and let her watch Murmur work against a fictional target class. He loved this part, and he watched her instead of the screen while it ran, because her face did what everyone's face did: resistance first, then unwilling respect.

Mateo still did not entirely believe the speed. That was the private fact he never offered in rooms where speed was his authority.

In 2022 he had photographed the first useful completion an editor gave him and sent it to Sofía like a magic trick. A line became a function. Then chat windows wrote files he copied by hand, reading the joins because the joins were where everything broke. Then the assistant entered the editor, read several files and offered a diff. Then it entered the terminal and ran the tests itself. Each change felt incremental while it happened. Looking back, the human role had moved from typing, to joining, to approving and to describing what success should look like.

Now he wrote a specification before bed and woke to candidates that had edited their own harness, failed, retried and ranked themselves while he slept. The first month, he checked the compute invoices against the dashboard because the number of attempted paths looked like a display bug. The second month, he checked less. By the fourth, disbelief had become an operational disadvantage. The people who paused to absorb what had changed lost a week to the people who treated astonishment as latency.

That was how intelligence got caught by acceleration. Not

because clever people could not understand the new thing, but because understanding took the same human hours it always had and the thing changed again before those hours were available. Mateo's doctrine made a virtue of the only response that kept him in the market: measure outputs, improve evaluations, stop demanding comprehension at the speed of production.

He believed the doctrine. He also needed it.

The loop laid out candidate attack surfaces, ranked them, generated test cases, executed, discarded, retried. On the laptop it looked like almost nothing: a log scrolling too fast to read, a token counter and a cost column climbing in one corner, a table of eval results filling row by row. In forty minutes it covered ground no human team would survey in a quarter. And then a row flagged a finding, and even Sofía leaned in.

"There," Mateo said, unable to keep it out of his voice. "That path. Nobody put that in it. No template, no seed paper. It noticed that two components trusted each other's expiry checks and neither one owned the clock between them. It found a disagreement, the exact kind of thing you find, except it can walk ten thousand disagreements a night and remember every one."

"It's good," she admitted. Her voice did the thing it did when she was being precise rather than kind. "Now show me the queue behind it. Not the twin."

He had prepared for this. He brought up the honest version of the number: findings awaiting human review, plotted against review capacity. Two curves, one going up forever and one flat.

"The reviewers can't keep up," she said.

"No system's reviewers can keep up. That's not failure,

that's scale. We sample. We prioritize by expected value."

"And the ones you don't prioritize?"

"Wait," he said. "With status. Honest status, visible to buyers. Nothing is hidden, nothing is mislabelled."

"Choose one that waited," Sofía said.

Mateo filtered the queue by age. The oldest candidate had been there nineteen days, generated by a small open model running on rented accelerators in Montevideo. Expected value low. Reproduction confidence sixty-two per cent. No named operator. The summary claimed an authorization discrepancy in a maintenance interface. The explanation was clumsy and repeated one sentence twice.

"This is what Ternhaven sees," he said. "No accountable researcher, bad prose, uncertain effect. They reject the origin and never discover whether the result is useful."

"And what do you do?"

"We let the harness decide."

He promoted the candidate. Murmur allocated a clean twin, converted the report into tests and ran them. The first reproduction failed. The agent revised the setup. The second failed differently. On the third it changed the evaluator itself, replacing an exact response check with a semantic one because the target returned the same meaning in a different field order.

The test went green.

Mateo felt the familiar lift before he read why. Candidate recovered. Queue age resolved. A thing abandoned for nineteen days had become valuable in ninety seconds.

Sofía opened the evaluator diff.

"It relaxed the test."

"It corrected a brittle assertion. The response is equivalent."

“Equivalent for the finding, or equivalent according to the same agent trying to make the finding pass?”

He pulled the raw responses. The target had returned a maintenance token in a field the original evaluator expected to be absent. The revised evaluator ignored that field because the natural-language specification did not name it. Whether the token made the claim stronger, weaker or different required somebody who understood the target class. The queue contained no such person. It contained a green result.

“We can send it to domain review,” he said.

“Will you?”

Expected value low. Review budget for the day already spent. The honest answer sat between them on the screen.

Mateo marked it *manual clarification required*. The candidate returned to the queue with a newer timestamp and therefore, he noticed only after clicking, moved behind two hundred and eleven other items.

“You saved it from a false positive,” he said.

“Or buried a true one. We don’t know.”

The machine had made generation cheap, reproduction fast and uncertainty abundant. Every branch ended at the same resource Morrow Array described as a legacy bottleneck: a person willing to spend an hour understanding what question had actually been answered.

“Scale means some things wait,” Mateo said.

“Scale means you decide who waits. You just hide the decision in expected value.”

He disliked the sentence because it was morally inflated and technically accurate.

Except, said the part of his mind he kept fed and busy, that closely related variants of one finding had gone out under

three separate names, priced separately, because no single human being at Morrow Array had ever seen the whole graph of what the queue contained, and he had known, and the knowing had felt like standing in current. Not hidden, nothing mislabelled. Reorganized. Optimized. He had told himself each sale was true in isolation, which was technically correct and therefore, by his own doctrine, irrelevant to notice.

On the bench behind them the stereo woman laughed at something the soldering man said, and Mateo thought of Micaela Ferreyra, whose evaluation notes on the dispatch tool were sitting in Morrow Array's ingestion pipeline right now, flagged competent, queued to have a name attached to them at the moment of maximum value. She would say yes if asked. That was the thing nobody understood who called it theft: she would be asked, eventually, and she would be proud, and the pride would be the price.

An operations notice opened in the corner of Mateo's screen. It used the neutral language Morrow Array reserved for acts somebody might later need to deny.

Vale pressure channel: school-account recovery confirmed. No content changed. Protective response triggered as forecast. Witness now under Ternhaven movement control. Recommend hold. Objective achieved.

He minimized it before Sofía could read.

The plan had sounded bounded when approved. Demonstrate access to an ordinary account Martin valued. Alter nothing, send no threat, collect no child data beyond what the recovery flow already exposed. The objective was not the daughter. It was to make Martin accept Ternhaven protection, moving his mixed record into a custody channel Morrow Array could observe and Ternhaven would have to defend.

Mateo had signed the budget line marked *identity recovery testing*. He had not seen the school name. That was the sentence available to him, and it sickened him by being true.

He reopened the notice after Sofía turned back to the harness. The operator had attached a screenshot of the recovery page as proof. A spelling test score. A teacher's comment praising a paper bridge. Information with no market value at all, which was why its use as pressure felt more intimate than stealing money.

He typed to the operator: *Delete captured content. Preserve access proof only.*

Retention required through settlement.

By whom?

The reply named Morrow Array counsel.

Mateo opened an exception request, then stopped at the field requiring business impact. Deleting a child's school screenshot had no measurable benefit to the market. Keeping it supported leverage over a witness whose record could destroy inventory. The form made the wrong action easy to justify because only the wrong action had a price.

He wrote: *Continued retention creates coercive exposure unrelated to technical objective.*

The evaluator rejected the exception in two seconds: *Assertion unsupported. Data remains within authorized investigation scope.*

He could call counsel. He could also walk out of the workshop, phone Martin and admit exactly how Morrow Array had reached his daughter. That would burn the pressure channel, the mixed-record strategy and possibly the settlement. It would also be the first action in the chain owned by a person rather than a policy.

Mateo did neither.

He marked the notice for human review, knowing the queue would not reach it before morning, and returned to Sofía with his face arranged around a doctrine about outputs. The decision was not dramatic enough to feel like choosing a side. Most complicity was a defer button with an honest label.

"What happens to cleanup?" Sofía asked.

"Cleanup?"

"In the reproduction harness. When a run finishes. Something has to tear the environment down, rotate the keys it saw, delete the scratch state. Who wrote that?"

He knew where the answer lived. It lived in a module the loop had extended itself, eight months ago, past its original design, reviewed by an operator who checked the diff against the tests the same module generated, and it worked, it ran green every single night, and he could describe its contract in three fluent sentences and had not read it since spring.

"The harness owns its lifecycle," he said. "It's validated end to end. Every night it runs green."

"That's not what I asked." She waited, patient as a clock. "What does it do? If I asked you to explain, right now, line by line, what the cleanup code does with the material it holds, could you tell me?"

There was a silence of maybe four seconds, and Mateo heard himself cross it.

"You're asking me to do a machine's job," he said, warm and easy, buying the seconds with charm because charm had always been his working capital. "The whole point of the stack is that I manage evaluations and budgets, not lines. You don't ask a pilot to explain metallurgy."

"A pilot can tell you what the flaps do," Sofía said. "You

just couldn't tell me what your own system does with a sealed target's leftovers."

And there it was, out in the open air between them, and he felt the strange relief of a deflection failing, like a tooth finally admitting it was bad. He did not answer. She let him not answer, which was worse than pressing, because she had learned that from watching systems, from knowing that a component that cannot explain itself will eventually fail in front of witnesses without any help from her.

She looked at his screen instead, at the burn-down curve resetting as the night's budget topped up, and he watched her watch it, and saw her recognize something before he did.

"Loss," she said quietly, pointing at the day's spent cycles. "Partial recovery, when a retry lands. An unexpected win, when the elegant finding surfaces. Increased stake." The curve climbed, reset, climbed. "One more run, Mateo. That's our trading screen. That's 2023. You're staring at the same dopamine with better typography."

"It isn't," he said, too fast. "Trading paid us for noise. Evaluations pay us with information. Every cycle produces signal whether it wins or not."

"Some nights," she conceded, and stood, and he understood that the concession was the whole argument: she had given him true things on both sides, and left him holding the difference.

At the door he stopped her, because some debts should be acknowledged in person.

"The five names," he said. "When you use them. Remember they said yes. All five, real people, real signatures. Whatever you think of the machine that drafted their confirmations, the humans agreed to stand behind it. Nobody forged any-

body. That has to count somewhere in your ledger."

"Does it count in yours?" she asked. "That you needed five?"

Then she was out the door into Almagro's evening, and he watched through the window as she walked three steps and stopped, the sudden full stop of a phone showing you something impossible.

He knew before he reached her, from the angle of her shoulders, roughly what it would be. A pre-authorization. A hotel in Neuquén, dated months ago, in her name, refunded flight attached, a journey she never took assembling itself into the commercial record one legitimate document at a time.

He had approved the dormant identity's reuse in principle, in a document with a budget line, and had told himself that provenance was a market question and identity was inventory, and had not asked to see the individual plays. Standing three metres from her back, watching her read the record of herself in a place she had never been, Mateo could not locate the exact moment when the doctrine had stopped being a door and started being a hallway with no other exits.

Chapter 14: Rosario Declaration

The bus to Rosario took four hours, which was exactly long enough to draft a confession six times and delete it six times.

She had told herself she was going for ordinary reasons. Tuesday was her rotated day off; the incident was closed; families existed and required maintenance like any other system. But the bus window had the Paraná crawling past in the late light and she knew the truth of it: after the hotel in Neuquén she could no longer pretend her history was private property. It was contested ground now. You do not leave contested ground unvisited by the people who might have to defend it later.

Tomas met her at the door of his house in Fisherton with tongs already in hand. Her brother managed fire the way she managed incidents: calmly, with checklists nobody else could see. The asado had been planned for weeks, some cousin's birthday, and the patio held his wife's family, two children chasing a dog, and their mother holding court over the ensalada with the authority of a woman who had managed pharmacy stock through three collapses of the currency and considered all current crises poorly organized.

Sofía kissed her mother, admired the salad, played five minutes of football with a six-year-old and conceded four goals with theatrical grief. All of it was true and all of it was delay, and Tomas clocked the delay, because he had shared a bedroom with her for seventeen years.

It was nearly eleven when the last guests left and he began closing down the grill for the night, raking embers into the wind-down zone, closing the vents. She stood beside him in the smoke smell with a glass of wine she was not drinking.

"I need to tell you something about the account," she said.

"Banca Roveda." He did not look up from the coals. "What about it."

"You knew the name."

"I know every name you don't say twice." He moved a log end with the tongs. "Talk to the fire. I'm listening."

So she talked to the fire. It was not one confession but several small ones, and the fire kept interrupting, because a grill does not pause for narrative: he had to close a vent mid-sentence, move meat that was still cooling on the rack, test an ember with the back of his knuckle. She got the whole thing out in pieces between his maintenance. That she had never declared the account. That some gains from those years stayed undeclared too. That the regularizing she had described to him at Christmas, the clean paperwork he had toasted, was a plan she had not yet begun and possibly could not begin without costs she had spent three years not pricing.

Tomas closed the last vent and stood looking at the dead coals.

"How much are we talking about," he said, "in terms of my sister going to prison?"

"I don't know. I've been telling myself fines, some lawful

way to put it right. I haven't asked independent counsel what the records actually mean."

"You don't know." He laughed once, without humour. "You know what I do all day? I tell people the exact percentage chances of things they're terrified of. I can't get one for my own sister because she's been managing me for three years with a story about a clean account."

"The account is real. The money is real. It came from my work, Tomas, not from anything else. I just never brought it fully inside."

"I don't care about the tax office's feelings." And here his voice changed, and she understood that the money had never been the wound. "I care that I reassured Mamá. Every time she worried, every asado where someone mentioned someone else's trouble with the tax authority, I said *no, Sofía's fine, she fixed all that.* Do you know what that's worth? I lent you my credibility. You've been spending it for years without telling me there was nothing backing it."

The sentence landed harder than any number would have. Because it was true. She had let him believe the regularization had happened precisely so that his reassurance would stand between her mother and any question. She had converted her brother's trust into a buffer asset, the same way she converted everything, and buffers exist to absorb shocks that other people were meant to receive.

"I'm sorry," she said, and it was the first sentence all night she had not drafted on the bus.

"Is this the AI thing?" Tomas asked.

She almost said no. The account predated Murmur and Inspeximus, and her tax exposure would remain if every model in the world went dark. But that was the kind of narrow an-

swer she had come here to stop giving.

“It’s part of why the old account matters now. Systems can produce more work than the people around them can understand. The market pays other systems to say the work was checked. My name is attached to some of those checks.”

“Checks you did?”

“One I did. Others I didn’t. The one I did was narrower than the way people used it.”

Tomas put the tongs down. “You think medicine doesn’t have this argument? The new anaesthesia station adjusts three things before I can reach one dial. It is better at holding a patient inside a range than the old machines were. I use it. I would be negligent not to. But when it alarms, the surgeon doesn’t ask the station what it believes. Everyone looks at me.”

“Because you understand it.”

“No. Because I’m there.” He wiped ash from his thumb. “I understand enough to know when to stop it and enough to answer for not stopping it. That isn’t the same as understanding everything inside. Nobody does now.”

The distinction bothered her because it was stronger than the position she had brought to the patio. Named responsibility did not require pretending one person contained the whole machine. It required locating the person who could interrupt it and the institution that gave them time to learn when interruption mattered.

“What happens,” she asked, “when the machine changes faster than you can learn the alarm?”

“Then the hospital owes me training or it owns the mistake.” Tomas picked the tongs up again. “And if it gives me neither, I don’t sign a form saying the patient was safe because the graph looked smooth. Smart people get frightened too, Sofi. We just

use longer words while it's happening."

He pointed the tongs at her. "First thing tomorrow I'll send you the name of the accountant who untangled a colleague's foreign-account filings. You call him this week. Not after whatever that hotel in Neuquén means. This week."

They went inside. Their mother was asleep in front of the television, and Tomas covered her with a blanket while Sofía watched, and nobody woke anyone.

She slept in her old room under the sloped ceiling, under shelves of books that had survived her leaving twice, and lay awake doing the arithmetic of who else had been spending her credibility. The memory came the way it always did now, uninvited and precise, wearing 2023.

Mateo at the kitchen table with both notebooks open, worried about the single route. Everything they earned abroad flowed through one processor, one bank, one wallet chain. If any node froze, they froze. Dependency on one path was a failure mode; she taught reliability, she of all people should see it.

And she had seen it, and her fix had not been diversification. It had been separation. Declared income through the front door, visible, taxed, boring. Verification proceeds somewhere else entirely, in the second wallet, attached to a second jurisdiction, with a paper wall between the two lives. She remembered proposing it across the pizza box, drawing the two columns on a napkin, *declared* and *actual*, and Mateo hesitating, actually hesitating, saying *are you sure you want to build it that way*, and her saying yes, because separation was the pattern she trusted: blast radius, containment, the failure that cannot spread. She had designed concealment the way she designed systems, well, and Mateo had gone along, and for three years

she had filed the whole architecture under *his idea*.

The napkin logic had even been correct, by its own lights. Contained failures protect the system around them. Nobody had asked whom the containment was protecting the system from being honest with.

In the morning Tomas made mate before dawn, standing at the counter in his hospital scrubs, and handed her the accountant's name written on the back of a shopping list.

"This week," he said.

"This week," she agreed, and it was even true, and they both knew the week had plans of its own, because her phone had buzzed twice against the nightstand overnight and she had not looked.

But that was tomorrow's problem. Today she hugged her mother, who patted her arm and said, with the terrifying indirectness of mothers, *you look thin, whatever it is, eat*, and Sofía said yes, Mamá, and meant it as a promise about more than food.

Chapter 15: The Other Sofía

The dossier arrived at noon by email, twelve pages, professionally formatted, from a company called Fides Custodia that Sofía had never heard of and that had, apparently, heard a great deal about her.

She had sent them one line that morning, after another sleepless hour over the Neuquén pre-authorization: *I am given to understand your presence system places me at an event in Neuquén in April. I was not there. Please send me everything you hold.* It was the same instinct as auditing herself first: read the accusation before it reads you.

Fides Custodia turned out to be Talud's presence-verification vendor, and their response was courteous, thorough and devastating.

April the nineteenth, according to their file, Sofía Alvarez had attended a sealed verification run at a facility outside Neuquén as an accredited human witness. Their evidence assembled itself across the page like a case study in how weak signals become strong proof. A flight to Neuquén, booked in her name, flown or not flown, refunded two days later in the way frequent travellers rebook. A hotel pre-authorization,

matching the refund window. A corporate expense approval from Aster Relay's travel desk for *client verification support, Patagonia region*. A card token registered to her wallet, used at a fuel station on Route 22 at 21:34. And beneath it all, the anchor: a signed witness attestation, badge log and a device attestation from a laptop whose hostname differed from hers by one character.

Every element was real. Each one came from a different commercial party, none of which had conspired, all of which had simply recorded what their systems saw. The journey had been manufactured out of true parts, the way a forged painting is made of authentic canvas, authentic pigments and one lie.

She sat in Tomas's kitchen with the printouts in rows and did what she did. She looked for the disagreement between records.

And found it, but not where she wanted. The fuel-station authorization was timestamped 21:34 local. The badge log held two events: 20:50, entry through the airlock into the sealed witness hall, and 23:12, exit through the same airlock. The hall had no other door and no way out without badging; Fides Custodia's own appendix said so, because the rule was what made its badge data worth buying. Route 22 lay forty minutes from the gate. If the badge log was true, the woman inside the hall could not have stood at a pump at 21:34. If the pump was true, the badge log was not.

The card statement, when she pulled it from the frozen personal account, made it worse. A contactless wallet payment, tapped at the pump terminal. Not her phone's token. A second token, provisioned to her card on a device she had never owned; somebody had enrolled another wallet as hers, and the network had treated it as her, because a provisioned token

was a promise that identity had been checked once. Her own phone had spent that evening, according to its photographs, at a rooftop asado in Palermo, camera roll timestamped against network logs.

One lie in a painting of truths. But when she marked up each element as real or fabricated, the pattern refused to settle into a single author. The flight and expense approval smelled like a travel platform compromise, which meant Morrow Array. The second token and the phantom tap smelled like compensation-channel work, which meant Ternhaven's intermediary. Two forgers, building one woman, each supplying half the canvas, neither apparently aware of the other's brushstrokes. The other Sofía was a joint production.

Then she reached page eleven, and stopped being able to breathe evenly.

The witness attestations were not all from April. Fides Custodia held seven runs across fourteen months and three markets. On four of them, the signature block carried a witness credential issued in 2023 to Sofía Alvarez. Not a forgery of her signature. Her actual credential, her actual key, signing actual sealed-test attestations at actual facilities, months apart, in a hand her hands had used exactly once, at midnight, three years younger, for a bonus about to expire.

She had assumed the dormant identity was stolen. Stolen she could fight; stolen was someone else wearing her. Page eleven said worse. The key had been preserved, maintained, kept alive like a heart on ice, and then used on real runs by whoever held it now. A genuine key proved only that somebody had held it. It said nothing about who had sat in the hall, or whether anyone had watched the test at all. But it made denial expensive. Every one of those signatures would

read as hers until someone independent pulled the halls' entry records, cameras and run instrumentation and showed who had stood where. Talud would not do that unprompted; the signatures were its inventory. She would have to force somebody to investigate, she realized with a cold that started in the spine, and she would begin every such conversation as the suspect, because the two women shared one signature.

The Fides Custodia portal refreshed.

A yellow banner appeared above the dossier: *credential activity detected while case open*. At 12:18, eighteen minutes after Fides Custodia sent her file, someone had used the dormant witness identity to request a renewal. The request included the correct old key, a current Aster Relay employment assertion and a liveness response that the portal summarized as *passed*.

The other Sofía was not merely preserved in old records. She was awake.

Sofía clicked *dispute credential*. The portal asked whether the key was stolen, lost or compromised. None described a key she had created, abandoned and allowed somebody else to preserve for three years. She chose compromised. A warning said revocation could invalidate attestations under active settlement and required approval by the sponsoring market.

Sponsor: Talud S.A.

She submitted anyway.

The case status changed to *pending counterparty review*. Estimated response: five business days.

Then an automated chat window opened. It knew her name. It asked her to confirm the last event she had witnessed under the credential. The available answers were four Neuquén dates, three facility codes and *none of these*. She chose none. The system lowered her identity confidence.

It asked which device she normally used. Two hostnames were nearly hers. One was the machine from the dossier. None was the laptop on Tomas's table. She chose *device not listed*. Confidence fell again.

It asked for the month the credential was issued. That answer she knew because she had found the original receipt in her own archive. November 2023. Confidence rose.

The recovery system was measuring her against the life built in her name. Every truth about the real Sofía that differed from the operational one counted as evidence against her. Every compromised fact she admitted pulled the score back up.

Additional verification required. A credential custodian will contact you.

At 12:31 her phone rang from a Buenos Aires number. She let it ring once, opened a recorder and answered. "I'm recording this call," she said, and waited until the man acknowledged it.

"Ms Alvarez," a man said in professional English. "I'm calling regarding a witness-access dispute. Before we continue, please confirm whether you requested renewal today."

"No. I requested revocation. Who requested renewal?"

"The credential holder."

"I am the credential holder."

"That is the matter under review. Can you confirm your location?"

Sofía looked through Tomas's kitchen window at the neighbour's water running down the gutter. "Rosario."

The man paused. "Our current presence signal places the credential holder in Buenos Aires."

"Then your presence signal is the dispute."

"I understand your concern. To protect both parties, the credential will remain active but restricted from new settlement signatures until review completes."

Both parties. The phrase converted identity theft into a service disagreement.

"Restricted how?"

"It may witness scheduled runs. It may not initiate an unscheduled run or change beneficiary instructions. Existing commitments remain valid."

"So whoever has it can keep producing evidence in my name."

"Existing scheduled activity is not evidence of compromise. Cancelling it could cause financial harm to a legitimate holder."

She asked for his name, case number and exact wording in writing. He provided all three. He was not threatening her. He was following a balanced process in which a fabricated person arrived with more recent activity than the woman who created the key.

Before ending the call he said, almost kindly, "If you have access to the original device, using it would resolve this much faster."

The original device had been wiped and sold in 2024. Mateo had complained that she always discarded hardware too carefully for sentiment. Whoever maintained her credential knew that too.

At 12:46 the renewal request completed under restriction. The portal issued a new expiry date six months away.

Sofía saved the call recording, the written case response and both versions of the portal page. She wrote their hashes on the dossier. The false woman had won no new authority, the

custodian said. She had only been guaranteed the right to continue what she was already doing.

The phone rang at three. Foreign country code.

"Señora Alvarez." The voice was low, precise, its Spanish softened by Italian vowels. "Rina Belluzzi, Banca Roveda client services. We have spoken twice in three years. I am calling against procedure, from a mobile, during my break."

"What's wrong?"

"Three things, briefly, because my break is fifteen minutes." Papers shuffled. "First. A replacement card for your account was requested nine days ago, through the app, passed identity review, delivered to an address in the bank's home country that is not yours, and activated. You did not request it?"

"You know I didn't. My cards are frozen. I froze everything the Friday my lunch bought itself."

"Correct. The request passed every check, because it answered every challenge correctly. Device, history, behavioural questions. Whoever requested it knows your patterns at our bank better than I do, and I have read your file." A pause. "Second. A vetted intermediary has been querying files connected to your account. Vetted means contracted through channels I am not permitted to describe, for purposes nobody will write down. My institution answers these queries. It is not wrongdoing on our side. It is the pipeline working as designed, which is worse."

"And third?"

"Third is me telling you this, which risks my employment, which is why the call is short." Rina's voice flattened into professionalism. "I am not your ally. I am not anyone's ally. I am an officer of a bank with a client file that has begun to generate irregular queries, and there are procedures for what I do next,

and I intend to follow them, because procedures are the only thing in this story that cannot be threatened."

"The fraud record," Sofía said. "The card request, the queries. Preserve it. File it formally, date-stamped, inside your own system, even if nobody asked you to. Especially if nobody asked you to."

"That creates a document I may have to justify."

"Yes. And if it's ever needed, it exists, and you can prove when you made it. That's the whole point of you, Rina. Be the clock."

The silence on the line lasted long enough that Sofía heard the break room around her: cups, distant Italian, a television.

"My shift ends at nine," Rina said. "Preservation requests filed before close are processed same day. Good evening, señora."

Afterward Sofía sat at Tomas's table among the twelve pages and understood the shape of the trap she was standing in. Because the false Sofía was, by now, easier to believe than the real one. The false Sofía had no second wallet, no midnight signature on a job whose cleanup she had argued into defensibility, no undeclared account generating irregular queries. The false Sofía travelled, witnessed, signed and paid for fuel with clean tokens. If a tribunal someday laid both histories side by side, the fabricated woman would look like the better person, and the only evidence the real one could offer in her own defence was the confession she had already given her brother in front of a dead grill.

Outside, Tomas's neighbour washed a car in the thin afternoon sun, radio on, some cumbia hit from last summer. Ordinary world, going about ordinary hours. Sofía gathered the pages, squared them, and put them in order by timestamp,

because that was the one act available to her that no forger could touch: decide, before anything else happened, what order things happened in.

Chapter 16: The Clock

The two requests arrived within four hours of each other on Wednesday, and each was individually the most boring email of Sofía's week.

She saw them together only because Tomas's guest-room wifi dropped during an afternoon storm and her phone fell back to mobile data, where the audit federation's ticket queue loaded in plain text, oldest first. The federation was the quiet achievement of Martin's best years: seven write-mostly audit sinks scattered across the hemisphere, each stamping event streams with time it owned, each administered by an engineer who had keys to a building and a duty to be annoying about procedure. Sofía was the designated operator for the Paraná node, a half rack in a cold aisle of a provincial colocation facility that had survived three owners and every flood since 2012.

São Paulo had convicted the first impossible receipt. Paraná was the regional collector: it retained São Paulo's signed stamps alongside the later witness streams, enough history to show whether nine minutes early was an accident or a practice.

Ticket one, filed 14:12 by a subcontractor she had never heard of, on behalf of a client she was not permitted to see: an exported reset of the node, citing infrastructure migration.

Full state transfer, then wipe and rekey. Paperwork immaculate. Signed by two people whose titles were longer than their names.

Ticket two, filed 17:48 by a facilities contractor booking emergency maintenance on the node's rack, power circuit and network uplinks, Thursday 06:00. Also immaculate. Cited a thermal incident in the neighbouring aisle.

Alone, either request would have sailed through on Thursday morning while she slept in. Together they were a pincer. The reset would hand the node's entire honest chronology to whoever received the export, and the maintenance window would put new hands on the machine before anyone could ask what the first request had taken. She did not need to know which faction stood behind which ticket. The choreography told her enough: both sides wanted the clock, and neither knew the other had booked it.

She checked the queue's approval state. Both tickets sat at stage two of four. Automatic checks passed, human sign-off pending, scheduled execution Thursday dawn. She had one night.

She booked the last rental car available in Rosario and called Tomas.

Tomas drove her to pick up the rental car at nine and asked no questions, which cost him visibly. At half past ten she took the autopista north out of Rosario towards Santa Fe, most of it empty dual carriageway through dark farmland, trucks for company, her coffee going cold in the cupholder. Two hours on, past Santa Fe, she went under the river through the Hernandarias tunnel, the Paraná running somewhere overhead, wide and black and indifferent as an unlogged stream, and came up on the Entre Ríos side with the city ahead.

She drove badly by her own standards, twice catching herself doing a hundred and forty with her thoughts somewhere else entirely, and made herself slow to the limit, because arriving mattered more than arriving fast and because a speeding fine in her name tonight would fit somebody's file a little too well.

The colocation facility hid behind a logistics park at the edge of the city: grey cladding, a single lit window where a night guard sat with a television murmuring, a roller door, a mantrap, cameras that had never been networked to anything interesting. Her keycard opened the outer door because her keycard had always opened the outer door. That was the whole of her superpower, and she leaned on it now. She was not a spy. She was the administrator. The building's own records would show, from tonight forward, exactly who had entered, when, and why, and she filled in the visitor log with her real name and the words *quarantine action, ticket review*, because the facility deserved true entries even if nobody else's week contained any.

The guard read what she wrote and frowned.

"Maintenance is at six," he said. "They called to move it forward."

"Who called?"

He turned the visitor book towards himself and checked a note clipped beneath the desk calendar. A first name, a mobile number and *thermal team, authorized*. No company. The time beside it was 00:17.

"They said two o'clock," he said. "I told them the ticket says six. They knew your name. Said you had approved overlap."

Her name had become a skeleton key in other people's mouths.

“I approved no overlap. If they arrive, they wait outside the mantrap. You call the facility duty manager, not the number on that note.”

“They have a work order.”

“So do I. Mine says quarantine and I am standing here with the operator key.”

The guard was not impressed by urgency. That was why the building still had honest cameras. He called the duty manager, woke her, read both ticket numbers aloud and handed Sofía the phone.

The manager knew the maintenance request. She also knew the reset request, which surprised Sofía until she understood that neither faction had hidden its paperwork from the facility. Secrecy was unnecessary when each request looked legitimate in isolation.

“Both are approved for execution,” the manager said. “You cannot cancel customer work from a lobby.”

“I’m not cancelling it. I’m invoking operator quarantine under the federation agreement. Section seven, conflicting custody instructions.”

There was keyboard noise. “That section is for seizure orders.”

“It says legal, customer or operational instructions that transfer control to different parties inside one retention window. It does not require a court. Read the second sentence.”

The manager read it. The silence that followed was not agreement. It was somebody discovering that boring language written years earlier had become expensive.

“Quarantine requires two operator signatures.”

“The regional federation is the second operator. I notified

São Paulo at 23:42. Their signed acknowledgement is in the ticket."

More keyboard noise.

"It is," the manager said.

At 01:08 the maintenance ticket changed state from approved to *held at site*. The reset ticket changed with it because neither could proceed without resolving the same custody conflict. Sofía took a photograph of the guard's screen showing both states, then asked him to print it. He used a laser printer old enough to warm the paper.

The guard slid the page across the desk as if it were a receipt for a parcel. She signed the bottom line with the same pen he had used, then added the reason in her own hand: *operator quarantine invoked; no transfer of control*. A copied screen could be disputed. Ink on a page would at least force somebody to name the dispute. She put the original in the visitor book and kept the duplicate in her coat, close enough to feel when she moved.

"You expecting trouble?" he asked.

"I'm expecting contractors. Trouble is a conclusion."

He looked at her for the first time with something like respect. "Cameras retain ninety days. Local recorder."

"Who can export?"

"Me and the morning supervisor."

"Please don't export anything for me tonight. Just don't shorten retention."

He wrote that request in the visitor book beneath her entry and signed his own name. Two people, one page, no drama. The first independent custody decision of the night had happened before she touched a server.

The node lived in rack B4, between a grain exporter's

telemetry stack and a municipal fibre switch. Four machines, no monitors, lights steady as sleeping animals. She crouched in the cold aisle with the maintenance manual open on her phone and worked by procedure, the way her hands did everything that mattered.

First, stop the intake feeds, cleanly, with notifications to the federation list, so the stopping itself became part of the record. Second, stop the writers, flush their buffers and unmount the archive volumes. Record the clean stop, then power down the archive node. Third, pull the network cables and coil them on top of the rack in plain sight, an act so old-fashioned it circled back to sophisticated: no port scan defeats a cable lying on a shelf. Fourth, attach the removed archive drives to her forensic dock through a hardware write blocker and image them to fresh disks, verifying the hashes and writing the labels by hand. The shutdown changed the machine; she recorded that too. The images preserved its stopped state, not its lost memory. The archive was smaller than its importance, a few hundred gigabytes of signed timestamps on solid-state disks, small enough to image twice and verify both.

Two hours, start to finish. The facility hummed around her. Once, near the end, headlights swept the loading bay, slowed, and moved on, some truck choosing another door, and she knelt motionless between racks with a screwdriver in her hand and her heart going like the failed drive in Agustin's pool, and after a minute the diesel smell faded and the hum resumed.

At half past three she stood, cracked her back, and looked at what she had made. A sealed archive, deaf and blind, holding every honest timestamp the region had fed it since spring. Two images verifying, padded cases open beside them, one destined for a safe deposit in Rosario come morning, one for

a drawer at the Microcentro office, neither for her apartment, neither for an online service, neither for anywhere with her name on the lease. Honest copies work only when custody is boring.

At 04:06 the real contractors arrived.

There were two of them in orange jackets, carrying a thermal camera, a tool case and the irritated fatigue of people called out at night for somebody else's emergency. The guard kept them in the outer lobby and called Sofía from the desk. She came out of the mantrap with the two fresh drives still running their verification pass behind her.

The older contractor held up his phone. "Work order F-2214. Circuit inspection, rack B aisle. We were told the operator had cleared early access."

"The operator did not. The ticket is held."

"It says approved here."

His screen did say approved. Sofía asked him not to touch it and photographed the page beside the facility clock. The work-order app showed a green banner and an approval time of 03:58, almost three hours after quarantine. Beneath the banner, in smaller type, the named approver was Sofía Alvarez.

The contractor looked from the phone to her badge. "That's you."

"That's my name. Show me the approval detail."

He tapped. The app generated a summary: operator contacted, custody conflict resolved, maintenance may proceed under visual supervision. It offered a transcript button. The contractor opened it and Sofía heard her own voice say, with her own Buenos Aires vowels, "Yes, bring them forward. I will meet them at the rack."

For one irrational second her body reacted as if she had for-

gotten making the call. The voice was not crude. It contained the little upward movement she used when giving an instruction she expected somebody to question. Whoever had made it had more than a sample. They had a model of how compliance sounded when it wore her mouth.

“You heard me approve it,” she said.

“Dispatch heard you,” the contractor replied. “I got a green job.”

He was not gullible. He was doing exactly what a sensible person did when an authenticated system, a recorded call and the woman named on both appeared to agree. Only the woman now disagreed, and she had arrived at four in the morning to unplug a customer’s equipment without dispatch knowing.

“Call the number in the original ticket,” she said.

“That’s the number that called us.”

“Then call your supervisor through your company directory. Not recent calls. Not a link in the work order. The directory you used before tonight.”

The younger contractor had said nothing yet. He put his case on the floor and opened a contacts app. “I have her saved.”

“Use that. Speaker, if you consent.”

They waited through six rings. The supervisor answered angry and became awake one fact at a time. She had not moved the job. Her dispatch system showed the same green approval, pushed by the client’s integration account. She had received no operator call, only an automatically generated completion note.

“Can you cancel it?” Sofía asked.

“The client has priority authority. I can decline attendance.

It will count against response time."

The older contractor swore softly. The penalty was his problem now: a false human approval had moved a corporate risk into two hourly workers' performance record.

Sofía asked the guard for the visitor log. "Write that you attended against a green work order, that the named operator disputed the approval in person and that no access occurred. Use your own words. Both of you sign."

"That doesn't fix the call-out," the older one said.

"No. It makes the call-out true. Your supervisor can use it to dispute the penalty."

He looked at the blank page. "You can sign that you turned us away."

"I will sign that I was present and the rack was quarantined. I cannot sign what your company promised to pay you."

The distinction annoyed him, as honest distinctions often annoyed the person who needed more from them. Then he wrote. The younger contractor added the time they received dispatch, the time they arrived and the asset number on the thermal camera they had not used. Sofía countersigned beneath their entries, the guard beneath hers.

While they wrote, another car stopped outside the barrier.

One man this time, no uniform, carrying a padded silver case. He did not try the door. He showed the camera a QR code and waited. The guard's console chimed with a separate instruction: authorized courier for state-transfer media, ticket F-2211, collection advanced to 04:15.

The reset and the maintenance had arrived nine minutes apart.

Sofía felt Martin's pincer close around a rack that was no longer connected to anything. If she had approved either job

in isolation, the next person would have completed the story. One crew opened the path. One courier carried away the clock. Neither needed to know the other existed.

She asked the guard to deny the courier at the barrier and preserve the entry request. The man waited while somebody argued through his earpiece, then held the silver case up to the camera as if its emptiness were proof of harmlessness. After seven minutes he left without approaching the building.

The contractors watched his tail-lights go.

"Same customer?" the younger one asked.

"I don't know."

"But you think so."

"I think two valid instructions tried to take control of one machine inside one retention window. The procedure does not require me to know why."

The older contractor tore the carbon copy from the visitor book and gave the original back to the guard. "I used to think these systems stopped arguments."

"They move the argument," Sofía said. "Usually to someone who wasn't in the meeting."

He glanced at the green job still shining on his phone. "Do I close it as customer unavailable or access refused?"

Both choices assigned fault. The app had no category for the customer being present and the permission being fictional.

"Neither," his supervisor said, still on speaker. "Leave it open. I'll take the breach."

That was the first expensive human decision the work-order system had recorded all night. It appeared as a grey clock beside the job: response overdue.

The contractors packed their unused tools and left. Sofía asked the guard to export nothing, change nothing and pre-

serve the local camera window under the facility's ordinary retention rule. He wrote the request beside the other entries. By breakfast, several systems would describe what had happened here. Only this one would admit that a person had refused to choose between two false answers.

She wrote the quarantine entry in the facility log, signed it, photographed every page, and emailed the federation from the parking lot at 04:41:

Paraná node quarantined at operator discretion pending review of tickets F-2211 and F-2214. Intake halted, volumes read-only, uplinks physically disconnected. Images taken. Execution of either ticket will require my physical presence and my keycard. I can be reached, but not quickly.

She watched the mail leave, then turned the phone off entirely, first time in six years, and sat in the rental car in the empty lot eating biscuits from a petrol station, and let herself feel the size of what she had done.

Because here was the joke the week had built. Both factions held dossiers placing her in Neuquén, Recoleta, two cities at once, a woman woven from real records into impossible journeys. And the one journey she had actually made, tonight, alone, documented by a guard's logbook, a visitor signature and a camera nobody had thought to suborn, was the one record in the entire war that was beyond forgery, because it had never been interesting until now.

They had spent months manufacturing her presence everywhere she had not been. She had just spent two hours establishing it where she was.

The sun came up over the logistics park like a slow boot sequence. She drove back towards the river with the two cases on the passenger seat belted in, thinking about the sentence

she had just signed into existence with her own hand: *execution will require my physical presence.* By nightfall, both sides' ticket systems would have parsed it. Neither faction could touch the clock without collecting Sofía Alvarez, in person, at a door she controlled.

For the first time since the first impossible receipt, being the prize felt like having leverage. She took the first exit for fuel, bought two more coffees and a bag of facturas, and pointed the car south, the sunrise on her left, towards her brother's kitchen table, where a telephone was almost certainly already ringing.

Chapter 17: The Old Story

The story reached Sofía the way most stories reached her that week: as a document she had not asked for, attached to an email she did not trust, from an address that had never written to her before.

The sender called itself Cuaderno del Paralelo, which sounded like a think tank and was, on inspection, a domain registered eleven days earlier. The attachment was a briefing titled *Talud, Ternhaven and the Custody Cartel: Notes Towards a Public Record*. Forty pages. Charts. Extracts from procurement notices. Screenshots of published committee rosters, with the same nine names boxed wherever they appeared. A timeline that began with appointments to standards panels and ended, without any visible join, at a sealed facility in Neuquén province where, the document alleged, Ternhaven had manufactured the failures it was now being paid to prevent.

It was a new wrapper around an old story: the vendor had made the emergency that only the vendor could solve. Sofía would need a second pass through the citations before she saw that the briefing had proved the profit and merely asserted the

plot.

It was beautifully made. That was the first thing she noticed, and the first thing that frightened her, because she had spent the week reading fabricated records and this one had the same quality: every individual element real, the joinery invisible. The appointments were real. The procurement notices were real. The committee overlaps were real. The conclusion, which sat on page two where a busy reader would meet it first, was not supported by anything else in the file, but it no longer needed to be. By page two the reader had already stopped checking.

She did what she now did automatically. She read the accusation last and the citations first, and she traced each citation to whatever custody it claimed.

The committee dates checked out and established conflicts that should have been disclosed. The contract notices showed Ternhaven profiting from standards its own people had helped write. Supplier invoices, insofar as the document summarized them, showed ordinary work billed by firms already listed in the tenders. The one claim that Ternhaven had caused any failure cited a source described only as *documentation reviewed by our researchers*, which was the citation equivalent of a receipt whose environment did not yet exist. She wrote *no supporting link* in her notebook, next to a list of everything the story needed to be true, and the list was entirely composed of things that were merely plausible.

Then, on the second pass, she went back to the boxed names, because something about their repetition had been waiting for her since page one.

She had seen this proof before. Not these people. This proof. Every failed incident review produced a version of it:

draw a line between everyone who had been in the same room, replace proximity with coordination, then treat the density of the page as evidence that somebody had issued orders.

The briefing was careful. It printed dates, names and contract values, then left the verbs to the reader. *Attended* became *planned*. *Advised* became *directed*. *Profited* became *caused*. The last step could never be quoted against the document because the document made its audience take it.

Nothing in forty pages was new except the citations. Somebody had taken a story older than her mother, dressed it in her own professional vocabulary, custody and provenance and sealed environments, and sent it to engineers, because engineers check things and checking takes longer than believing.

By the time she reached page thirty, the document had acquired witnesses.

A technology newsletter quoted its executive summary with the phrase *independent research suggests*. A political account quoted the newsletter as *new reporting* and, within the hour, reported a centrally directed sabotage programme. Nothing in the briefing supported central direction; the account supplied it because the diagram had been built to summon it. A market analyst fed both into a live assistant and asked for implications; the assistant produced a concise chain from committee overlap to coordinated sabotage, citing the two articles as separate confirmation. Cuaderno del Paralelo updated its website to link to the analyst's post under *external coverage*.

The circle closed in forty-three minutes.

Sofía saved each version with its publication time. The claims grew more certain as they moved further from the

document. *Notes towards a public record* became *research suggests*, then *new reporting indicates*, then a summary sentence without a verb of uncertainty at all. Nobody forged a source. Every publisher inherited confidence from the existence of the previous publisher.

She sent the citation chain to Aster Relay's approved assistant and asked it to identify independent evidence. It counted four sources. When she instructed it to collapse citations by originating claim, it counted one. When she asked why the first answer had counted four, it explained that separate domains and authors increased corroboration confidence.

"They copied each other," Sofía typed.

Cross-source agreement remains a useful signal even where information overlap is possible.

"The overlap is shown in the links."

The assistant recalculated and lowered confidence from high to moderate. It did not withdraw the conclusion. The cartel story fit too many patterns in its retrieval context: committee overlap, concentrated procurement, security research, emergency contracts. Each real association made the unsupported join feel less expensive.

Sofía built a small table: source, claimed evidence, parent citation, first appearance. All four branches reduced to the same paragraph on page two. She posted the table privately to Daniel's review channel with no conclusion beyond *these are not independent sources*.

Three minutes later an account she did not recognize requested access. Its profile described an open-source intelligence researcher. The account had been created that morning and already had eight thousand followers.

She declined.

The request returned through a journalist she did recognize, accompanied by a reasonable question: could Aster Relay confirm whether its employee had reviewed a standard drafted by representatives of Ternhaven? Sofía had. The answer was yes. Any answer longer than yes risked lending the rest of the story her denial.

Aster Relay communications replied that employees reviewed public industry standards in their professional capacity and the company had no comment on speculative claims. Accurate. Useless. By evening the response appeared in a post titled *Aster Relay confirms involvement*.

Sofía watched a real review she had performed become corroboration for a conspiracy and understood why the false story had been released now. It did not need to persuade her. It needed to make every later technical objection look like a participant managing exposure.

Mateo called at six, from a road, wind past his window.

"You've seen the cartel piece," he said. Not a question.

"I've seen a document."

"Everyone's seen it by tomorrow morning, that's how these work now. One well-made file, seeded in four places, and by the weekend it has citations of itself." He let the wind fill the line for a moment. "I want you to know it came from our side of the fence. And I want you to sit with why we're the ones who pushed it."

"Because you want it to be true," Sofía said.

"Because it would work." No apology in it. "Ternhaven is a company built inside a procurement relationship. Nine of their senior people wrote the custody standards they now sell against, on industry committees four of them still sit on. Their access, their contracts, their whole moral posture about

custody, it all breathes through those ties." A truck went past him, or he went past a truck. "That part is true and I can document it, and it is worth nothing, because capture is a spreadsheet and nobody clears a market over a spreadsheet. You can't prove witness fraud against them in a technical venue either; their reviewers are too good and too patient. But a sabotage story doesn't need proof, it needs plausibility. It freezes them for a year. It freezes their premium, their procurement, everything. One document does what none of Murmur's findings can do." He paused, and when he continued his voice had dropped its salesman register. "You've read it. Tell me it isn't tight."

"The conflicts are real. The command doesn't exist. There's nothing between the committee seats and the failures except the layout, and the layout was designed so you'd stop looking." She heard him exhale. "You had a true story. Nine people and four committees. You put it in a drawer because it wasn't ugly enough, then sold sabotage because disclosure was too boring." She was standing now, without having decided to. "You taught me spreads, Mateo. This is a spread. Every leg is real and the arbitrage is fiction. You know exactly what you're selling."

He was quiet long enough that she thought the call had dropped.

"She says no," Mateo said finally, to someone in the car who was not there. "All right. All right." And then, to her: "For the record, I didn't write it. I just hoped. There's a difference, and I'm aware how thin it is from where you're standing."

"It's the thinnest part," she said, and hung up, because he had given her something worth more than the argument: confirmation of whose narrative the document served,

volunteered by the man who wanted it.

Micaela sent a photograph ten minutes later.

It showed the contributor dashboard on the repaired tablet. She had completed forty-seven tasks. Six accepted, nine inconclusive, thirty-two failed. Morrow Array had paid for the six and added a performance badge beside her name: **DOMAIN REVIEWER, URBAN LOGISTICS**.

Look, Micaela wrote. *Reviewer. Apparently I am one now.*

The title was both deserved and dangerous. Micaela had reviewed real operational effects in the domain she understood better than anyone at Morrow Array. She had not reviewed the code, the security boundary or any package assembled from those effects. The dashboard compressed the distinction into a badge because badges needed to travel.

Sofía called her.

"Congratulations," she said first, because refusing the achievement would make the warning inaudible.

"You sound like Tomas at a graduation. What's wrong?"

"Does the dashboard let you open the accepted records?"

Micaela opened one. Her evaluation appeared beneath the proposed result, name, date and a green chain icon labelled *available for aggregation*. The original task ID was visible. The dispatch data remained redacted. Nothing on the page claimed she had reviewed security.

"Download all six," Sofía said. "And the failed ones."

"Why the failed ones? Nobody paid for those."

"Because they prove what the badge means. Six passes without thirty-two failures looks like authority. All forty-seven together look like work."

The export function produced a signed archive and a summary certificate. On the certificate, Micaela's role had changed

again: *evaluation contributor* in the task records, *reviewing evaluator* in the summary.

"That's the same thing," Micaela said.

"Today, maybe. What can a reviewing evaluator be attached to?"

Micaela searched the help page. Aggregated findings, quality summaries, contributor packages and settlement evidence. The last phrase linked to a policy accessible only to market accounts.

"I don't have a market account."

"Your name might."

The pride drained from the call without disappearing completely, which was worse. The six tasks had been useful. The money had paid Ariel's waiting time, two workshop invoices and part of Micaela's tax bill. A system could recognize her competence and still take more consent than she understood. Exploitation did not require the praise to be false.

"Can I withdraw?" she asked.

The dashboard offered *close contributor account*. A warning said accepted evaluations would remain in derived records for integrity. Attribution would be retained where required by custody policy.

"Not backwards," Micaela said, remembering the phrase from the workshop. "Nothing revokes backwards."

"Export first. Then don't close it yet. Closing might remove the access you need to see where the records go."

"So I keep working for them?"

"No. Stop evaluating. Keep the window."

Micaela downloaded the archive and sent copies to herself, Agustin and Sofía. Then she changed her contributor status to unavailable. The badge remained.

Before hanging up she said, "The duplicate payment was real. We stopped losing that money. Don't let them make me ashamed of the part I did well."

"I won't," Sofía said.

The call left her looking at Cuaderno del Paralelo's forty-page accusation beside a six-task certificate. One story inflated weak evidence until it could carry a covert command. The other inflated narrow competence until it could carry a market package. Both depended on the reader accepting the title before checking the work.

Agustin's email arrived at half past nine that night. Two lines of text, a spreadsheet, and no greeting beyond her name, because he had promised one comparison and he delivered exactly what he promised and nothing more.

Did the thing you asked. The mirror kept everything. Dates below are commit times from our side, which nobody outside the room could have adjusted after the fact, because nobody outside the room has ever had the key.

She opened the spreadsheet and found the chronology of a single zero-day claim: when it first appeared in discussion, which fork branch held it, when it moved, and when Talud's public-facing receipts, pulled from the trial notices Martin had once followed, dated its certification.

The claim had lived in the branch that accepted disclosed assistance with human sign-off. Then it moved to the branch that banned AI-origin reports entirely, and its authorship trail vanished in the crossing, exactly as they had reconstructed behind Cable Rojo's rehearsal room. But the dates told the rest. The move between branches preceded Talud's earliest receipt for the same claim by nineteen days. The claim had been discussed, forked and re-labelled before Talud's receipt ever

dated it. That proved less than she wanted. A receipt could honestly certify an older idea; people tested old findings every day. What it could not be was the claim's birth certificate, and the listing used it as one.

She sat with the spreadsheet open for a long time, feeling the shape of the whole thing settle into place around this one clean column of dates. It was the first artefact she owned from outside the pods themselves, and it spoke only to provenance. Agustin had given her exactly one comparison, and she made herself claim no more for it than it held.

At the bottom of the mail, below the signature-free sign-off, one further line, added apparently against his own policy of saying less:

Whatever this is, it looks worse than your ticket queue. Don't sign anything that feels satisfying.

She drafted a reply, deleted it, and sent him instead: *Received. Thank you for keeping the archive.* He had asked nothing about her finances or her love life, and she was not going to spend his goodwill on either.

The cartel briefing was still in her inbox, forty pages long, and she caught herself reading its conclusion again, feeling the pull of it. Because the story was useful, not credible. If she repeated it, everything simplified: one scapegoat, one scandal, one freeze. It was the most effective unsupported inference anyone had handed her since this started, and it required her to sign precisely the thing the evidence did not support, which made it a rehearsal. Somewhere ahead of her was a room where people with badges would ask her to state what she knew, and the question was whether she would say what was true or what worked.

She filed the document in her evidence archive, tagged *un-*

supported, beside Rina's warnings and the twelve pages from Fides Custodia. Then she put Agustin's spreadsheet beside it: two lines of introduction, dates held by a mirror nobody had thought important enough to buy.

One account needed forty pages to cross the distance between a conference and a crime. The other needed a column of times. She knew which one she was willing to carry into the room, when there was one.

Chapter 18: No Quorum

With the cartel briefing refused and filed, Sofía finally built the overlay she had been carrying around in pieces for a week.

She did it on the kitchen table in Palermo, the one surface in the apartment that wasn't also a screen. She taped together four printouts, opened her notebook to a blank spread, and drew the timeline by hand before letting any software near it. Four layers, four colours.

Only after the sources were fixed did she give a redacted table of times to Aster Relay's approved analysis assistant. She asked for interval overlaps, clock-domain conversions and duplicate identifiers. No authorship. No motive. No instruction to decide what the pattern meant.

It returned eleven candidate crossings in thirty seconds. Eight vanished under review: daylight-saving assumptions in foreign records, one duplicated receipt, two event times confused with processing times. Three survived. Work that would have taken her most of a night had taken an hour, including the time required to disprove the assistant's confident mistakes.

At the bottom it added a finding she had not requested: *Pattern is consistent with coordinated institutional pre-positioning, confidence 0.81.* Its citations were a committee roster, a contract

timeline and the Cuaderno del Paralelo briefing, three repetitions of the same unsupported join. The assistant had crossed the distance from useful arithmetic to an accusation of central command without experiencing distance at all.

She deleted the conclusion and kept the three intervals. Bounded assistance did not mean the tool stayed inside the boundary. It meant the person using it knew which outputs had crossed.

The first layer was the receipt chronology: every Talud certification she could legitimately see from the incident and the federation's own notices, including the nine-minute case that had started everything.

The second layer was Morrow Array's authorship record, reconstructed from chapter and verse of what Mateo had shown her and what she had traced herself: findings generated by Murmur, human names attached afterwards, variants of one discovery sold under separate labels because no single reviewer ever saw the whole graph.

The third layer was Inspeximus's: Ternhaven's adversarial pipeline fingerprinting model output, generating hostile cases, feeding dead ends into Morrow Array's queue, and labelling genuine rival discoveries as derivative when provenance mattered more than effect.

The fourth layer she drew last, in red, because it belonged to neither faction. It was Martin's mixed record, the thing he had built and tried to sell twice, whose existence she knew from his trail and whose contents she still had not seen.

She laid the layers over each other and looked for the disagreement between records, the way she always had, and this time the disagreement was not a discrepancy hiding in one system. It was the whole architecture.

Because the two witness populations were supposed to be independent. That was Talud's entire product. Quorum meant that separate parties, with separate incentives, operating separate appliances, had each certified the same sealed test without collusion, and the market paid Talud precisely for that separation. Ternhaven supplied human-provenance witnesses. Morrow Array supplied model-side witnesses. Neither trusted the other, which was the guarantee.

Except both sides had spent the past year pre-minting inventory. Morrow Array minted receipts ahead of scheduled runs so variants could later sell as distinct discoveries with clean chronology. Ternhaven ran warm replacement appliances so its human-witness line could certify on schedule regardless of when anything actually happened. Each side assumed its own schedule was the private one, and each side built its forward-dated records against the other side's *announced* calendar.

Their schedules collided.

She tried to make that conclusion false.

First she shifted every uncertain clock to the edge of its documented tolerance. São Paulo moved by thirty-eight milliseconds, Aster Relay by twelve, the facility logs by almost a second. The crossings remained minutes wide.

Then she treated every duplicated identifier as a retry rather than a separate witness. One crossing disappeared. Two remained.

She removed Martin's draft entirely. The pattern became harder to see and no less true. That mattered. A missing man's compromised record could point towards a claim; it could not be allowed to carry one.

She called the federation operator in São Paulo, a woman named Camila who had signed the node's last key rotation

and disliked unplanned conversations.

“I need you to verify three stamp ranges,” Sofía said. “Do not tell me what they mean. Tell me whether your node could have issued them after receiving backfill.”

Camila asked for the ticket number, found none, and made Sofía open one. She then required the identifiers through the federation’s authenticated channel rather than accept them over the phone. Twelve minutes passed. The discipline felt unbearable only because it was working.

“First range is live intake,” Camila said. “Second also. Third arrived during a reconnect, but the source counter is continuous from before the disconnect. It was buffered at source, not created later.”

“Can the source counter be reset?”

“With a key rotation. There wasn’t one.”

“Can you sign that?”

“I can sign what I just checked. I will not sign your implication.”

“Good. Don’t.”

The statement arrived six minutes later: three bounded facts, no conclusion. Sofía printed it and added it as a fifth colour outside the faction layers. The continuous counter turned the third range from a retry back into a witness, and the crossing she had dropped returned.

Next she asked the assistant for alternative explanations constrained to the facts she had verified. It offered clock skew, retry replay, shared upstream scheduling, operator collusion and pre-issued receipts. She had already excluded the first two. Shared scheduling could explain why the same future target appeared in both witness populations, but not why each population signed before the target existed.

Operator collusion required Ternhaven and Morrow Array to cooperate on a record that damaged both of their pricing models. Possible, not supported. Pre-issuance explained every surviving interval with the fewest invented actors.

The assistant ranked collusion highest because the faction names co-occurred in its retrieved documents. She discarded the rank and kept the list.

Finally she removed the nine-minute case that had started her investigation. The other crossings still described the same practice. Her first anomaly was not a unique miracle. It was simply the instance that leaked into a system where somebody still compared event time to cause.

Only then did she write *schedules collided* in ink.

She found it in three places on the overlay where the colours crossed. At each crossing, a Ternhaven witness and a Morrow Array witness had certified the same test, both records dated correctly by their own clocks, both fabricated. Nothing on the page showed that either side had known about the other; she wrote that down as provisional, because she could not prove a negative. The quorums at those crossings had been accepted at intake: right keys, right roles, right count, which was all the root format checked. Whether each signature was a valid observation under Talud's schema was a different question, asked by a different field, and nobody had asked it. The two histories certified each other. A Ternhaven witness had put its signature under a Morrow Array fiction; a Morrow Array witness had witnessed a Ternhaven appliance running hot in a crate. If either faction exposed the practice, it exposed its own.

That was why neither side could stop the corruption now. Not secrecy. Mutual hostage.

Martin's red layer explained itself once she saw the cross-

ings. He had found the same collision months ago, from inside, as a human witness who kept honest notes, and instead of reporting it he had built a third record: a continuity file mixing elements of both frauds, provable enough to hurt either side, held by him alone. Two buyers, mutual exposure, neutrality through opposing fear. His flaw, laid out on the kitchen table in coloured ink, was exactly as simple as she had suspected since Toronto went quiet.

Near midnight, the public confirmation arrived without asking her. Talud published a ceremony notice, ordinary in form and extraordinary in date: an emergency root ceremony, Monday night, at which all existing receipts would be migrated under new witness keys ahead of *settlement scheduled for Tuesday*. The largest AI-generated zero-day auction in the market's short history, settling through conventional bank legs and stablecoin escrow at once. Every old receipt, including every crossing, every pre-minted forgery, would join the new root. The notice was precise about that: settlement would reference a single root over the whole history, and a root over part of it was a different root, one the escrow had never heard of. After Monday, the mixed history became permanent infrastructure. Refuse the migration and dangerous submissions returned to uncertain custody, which served nobody except whoever wanted the market dark.

Four days.

Her phone rang while she was photographing the overlay. Seattle area code.

"Sofía. It's Daniel." A pause she had learned to hear as him choosing words with both hands. "Two things. First, official. Aster Relay has been invited to a customer review session at Piedra Sola from tomorrow, part of the standard pre-

settlement assurance our contract entitles us to. I'm authorizing you to attend as our technical delegate. You'll have legitimate access, legitimate cover, and a legitimate reason to be in the building. I've also put you on the exception as its integrity contact. If anyone asks who speaks for us on that file, it's you."

"And the second thing."

"The second thing isn't official." Paper moved somewhere near his desk. "I've been reading the integrity case we opened beside your incident. The review came back unable to validate the sponsor attestation. I have asked counsel what our policy thinks *unable* means, and I'm not ready to say more than that before Monday." Another pause. "Your name is already on Talud's human-witness list, by the way. Has been since April. You may want to think about what you're going to do when someone in that building asks you why."

"I didn't sign up in April."

"I know," Daniel said. "That's what worries me about how well it will fit."

He hung up before she could answer, and she sat looking at the phone, then at the overlay, where the red layer crossed both coloured frauds and belonged to a missing man.

She thought about Agustin's warning. *Don't sign anything that feels satisfying.* Everything about the coming week would feel satisfying. Exposing Inspeximus would satisfy Mateo's account of the world. Exposing Murmur would satisfy Noa's. Accepting either satisfaction would wire her, signature first, into somebody's settlement ledger.

What she could actually prove was smaller than any of it, and she wrote it out in her notebook in plain words, so she would recognize it later under pressure:

Talud's rule: three accepted observations, from at least two

supplier lines, each made inside the target's live interval, ready to cleanup, within the clock tolerance. Field seventeen, witness_observation_time. At these crossings none qualified. Therefore no valid quorum formed. Nothing more than that. Not what the exploits are worth, not who authored them, not what either company deserves. Only when.

It was not satisfying at all. She read it back twice and made herself stop looking for a way to make it bigger.

She closed the notebook and left the overlay drying on the table. The red line crossed both factions at three points, holding the only complete account of the collision that anyone, on either side, had bothered to assemble.

Four days from now, every line on the page would be invited to call itself one history. She had until then to keep them separate.

Part Three: The Forty-Seven Minutes

Road, Aeroparque, Piedra Sola. Four days before settlement.

Chapter 19: Gate Thirty-One

Mateo crossed into Río Negro on the second day of driving, with three witness appliances in padded cases wedged behind the seats of a rented pickup and the heater fighting a losing war against the Patagonian wind.

The hardware was real. That much he kept telling himself, and it kept being true. Sealed units, current firmware, custody chains that would survive an audit, each appliance capable of doing exactly the work its documentation described. He had checked every unit himself before loading them, because whatever else he had become this year, his kit still worked.

The collective was another matter.

He had promised Morrow Array's logistics desk a delivery to the *Colectivo de Investigación Abierta del Sur*, eleven researchers, stateless by choice, operating outside both factions' provenance regimes. The collective existed in the sense that a group chat existed. It had a name because names were free. Its membership was four people, two of whom had never answered a message since March, one of whom was primarily a photographer, and a student in Bahía Blanca who believed, with a sincerity Mateo found almost unbearable, that open wit-

nessing could outcompete both Ternhaven's human premium and Morrow Array's volume. Nobody in the collective could service a witness appliance. Nobody had asked for three.

Morrow Array wanted the delivery made and photographed. Excluded researchers receiving real hardware made good material for the account of the world where Morrow Array was infrastructure for everyone the incumbents had priced out. The photograph would be true. Everything around it would be arranged. He had built a career on insisting that arrangement was not lies, only selection, and the sentence had begun to taste like fuel.

At a fuel stop outside Viedma he bought coffee and stood at the counter doing the arithmetic he had been avoiding since Buenos Aires. The appliances in his truck, if they reached their scheduled runs, would certify on dates already chosen for commercial convenience. He knew that now. He had known it since the collision surfaced, since the crossing quorums appeared in the reconciliation and nobody on his side moved to burn the inventory. His own doctrine said origin did not matter; output was true or false regardless of who produced it, and the market should judge the work, not the worker. But what he was driving south was not output. It was future agreement, sold before any test existed, and there was no version of *judge the work* that survived that. He had spent two days looking for one, because the alternative was to admit that Sofía had been right about him three years ago, in a rented flat in Córdoba, when she told him he fell in love with systems faster than he learned to maintain them.

He drove on. The road ran straight through country that did not care about his doctrine: wind farms turning slow against the plateau, a school bus, sheep fences running to

the horizon, a town whose water tower carried somebody's painted name. People lived here. The trucks came through here. The facility he was delivering towards sat inside all this ordinary life like any other tenant, paying rates and employing guards, which was somehow more damning than if it had floated in emptiness.

His phone, mounted on the dash, showed the delivery confirmation form. Signatory: collective representative. He had listed himself.

The delivery address was a vocational school workshop outside San Antonio Oeste. On Fridays it taught refrigeration and solar installation. On weekends Pilar Acosta, the Bahía Blanca student, borrowed one bench and the school's reliable connection for the collective that mostly existed in her messages.

She was twenty-two, wore a welding jacket over a university T-shirt and had brought two people: the photographer and an instructor who thought they were receiving donated network equipment. Eleven researchers had become three people in a room with six chairs.

"Where is everyone?" Mateo asked, hating himself for asking.

"Online," Pilar said. "Two are working. One lost access to the group after changing phones. The others were interested when this was theory. Hardware has customs, electricity and a person who gets called when it beeps."

She opened the first case and read the custody sheet before touching the appliance. That impressed him until he realized he had expected gratitude to arrive ahead of competence.

"Three units?"

"Capacity for independent witnessing."

"We asked for one."

“One isn’t a quorum.”

“Three appliances owned by the same donor aren’t independent.”

Mateo began the answer Morrow Array used in briefings, about separate keys and disclosed origin. Pilar stopped him by pointing to the delivery form.

“Representative signature transfers custody of all three to the collective. If I sign, who pays power?”

“Morrow Array covers twelve months.”

“Then?”

“The programme reviews renewal.”

“Who repairs them?”

“Remote support.”

“From where?”

He did not know. The cases had travelled a thousand kilometres under a narrative about local access without acquiring one local maintainer.

The photographer wanted the picture before the light changed. He arranged Pilar behind the three open cases, school workshop in the background, and asked Mateo to stand at one side. The photograph would be true: excluded researchers receiving real hardware. Pilar looked at the camera, then closed two cases.

“One,” she said. “We take one for ninety days. Separate agreement. No settlement signatures until we reproduce the service tests and know what the counters mean.”

“The campaign needs three.”

“The campaign can pay actors.”

The instructor looked away, embarrassed by the directness. Mateo felt, beneath the embarrassment, relief.

He called Morrow Array logistics. The operator said par-

tial delivery would invalidate the access grant. All units had to be transferred as a set because the programme measured deployed quorum capacity. Mateo asked where that requirement appeared in the recipient terms. The operator referred him to the donor terms, which Pilar had never received.

"Then delivery fails," she said.

The photographer lowered the camera.

Mateo could leave with all three and report that the collective lacked operational readiness. The sentence would be defensible. It would also turn Pilar's refusal to accept unmaintainable infrastructure into evidence that excluded researchers were not ready for access.

He changed the form. One unit, temporary evaluation custody, no production witness status, power stipend paid in advance, return shipping guaranteed. He signed for the other two himself.

The logistics application rejected the altered form. Mateo printed it through the school office, crossed out the three-unit quantity by hand and had Pilar, the instructor and himself initial the change. The system continued to show delivery failed. The appliance stayed on her bench anyway.

"This won't count for the programme," he said.

"It counts here."

She asked him to show where the emergency stop lived. He opened the manual, found the isolation sequence and made her perform it before power-on. The session lasted two hours. They found one translated warning wrong, one service endpoint unavailable from Argentina and a battery replacement interval omitted from the cost model. They also brought the unit online and verified its factory counter. Capability arrived, slower than the photograph and under terms the campaign

could not use.

When Mateo left, the two rejected cases returned to the pickup. The delivery dashboard called the trip a failure. On the workbench behind him, one new witness sat powered off until its custodian understood how to stop it.

Sofía's ticket cancelled itself while she was in the security line.

She felt the phone buzz at 10:12, boarding pass already in her wallet app, gate Thirty-One at Aeroparque, the Neuquén flight, and the cancellation notice arrived with the cheerful finality of a system doing its job: *schedule change; new itinerary to follow*. No new itinerary followed. Her booking, made Thursday night through Aster Relay's travel desk under Daniel's authorization, simply ceased.

She had budgeted for this. The second seat existed before the first died: a personal fare, different carrier, bought the same night from Palermo with her own card, the card Rina's institution knew about, which was the point. Two valid boarding records for the same woman, same morning, same airport, different routes. Whichever record the watchers chose to believe, the other one would contradict it, and she would know who held which file by how they reacted.

Because there were watchers. She had counted on that too.

Noa she expected and found: business class lounge guest, legitimate consulting cover, a small nod across the terminal that committed neither of them to anything. The other two were less polite. Sofía ran her own route through the terminal the way she read clocks. She walked past the kiosks once without stopping, doubled back for coffee she did not want,

changed direction at the last moment before the moving walkway, and watched the correlation.

Two men adjusted. Not together. One, grey jacket, tall, broke off his pretend phone call within a second of her reversal and drifted towards the gate boards. The other, shorter, denim, took longer, maybe four seconds, and overcorrected, ending up ahead of her instead of behind, which professionals did not do unless they had just inherited the tail from someone else's handover. Grey jacket moved when she moved, smoothly, bored-looking, rehearsed. Denim moved when grey jacket moved.

That interested her more than being followed at all. She tested it twice more at the gates area, small changes, a false step towards the toilets, a pause at a bookshop window, and the pattern held. Denim was not watching her. Denim was watching grey jacket, and correcting around him, and grey jacket either had not noticed or had noticed and considered denim someone else's problem. Two factions, each certain it owned the observation post, each the other's blind spot, and she was the overlap. Neither of them could report her movements without reporting the other one's presence, which meant both reports would arrive contaminated, and contaminated reports created hesitation, and hesitation was hours. She could spend hours.

She bought water and a sandwich and ate half of it at the gate, deliberately visible, deliberately boring, letting both men log a woman waiting for a flight that, according to one of her two boarding records, she was not on.

Noa passed close enough to speak without stopping. "Grey jacket is yours," she said, in English, eyes forward. "Mine doesn't fly until tonight. Enjoy being popular."

"Which side is he?"

"No idea. Ours stopped pretending to be clever about it months ago." A flicker of something crossed her face that was nearly humour and mostly tiredness. "You know what happens Tuesday."

"I know what I can prove."

"That's not the same as knowing." And she was gone towards the lounges, exact and unhurried, a woman whose market was dying in four days and whose walk did not show it.

Boarding began at 11:40. Sofía used the personal ticket, the personal card still loose in her pocket where she could feel it, and watched the gate agent scan her through without interest. Behind her in the jet bridge, grey jacket boarded too, three places back, no longer pretending. She did not look for denim. Somewhere in the terminal he was composing a report about a man on a flight he was not booked on, and the report would take time she intended to use.

Grey jacket had the aisle seat across from her. He waited until the doors closed, then took out a laptop and opened a spreadsheet, the machine turned a quarter towards the aisle so that its privacy filter blanked the window seat beside him and left one clear angle, hers. Passenger names, booking references, risk colours. Her Aster Relay ticket appeared in grey, cancelled. Her personal ticket appeared in amber, boarded. Beside it the system had written *probable itinerary recovery*.

He wanted her to know the second route had not made her invisible.

Sofía took out her notebook and wrote the exact time the spreadsheet appeared. She did not photograph him. A photograph would turn the exchange into confrontation and give him a reason to claim she had collected restricted passenger

data. Instead she wrote his seat number, jacket colour, device sticker and the three column headings she could read.

He angled the screen further towards her.

A third itinerary appeared under her name: an overnight coach from Buenos Aires to Bariloche, ticket issued at 10:16, four minutes after her Aster Relay flight cancelled. Status: boarded pending. The bus would not leave until evening. By then she would be in Neuquén, but the record would spend eight hours describing another possible woman moving south by road.

Sofía leaned across the aisle. "You misspelled my second surname."

The man looked at her for the first time.

"On the coach booking," she said. "If you're going to preserve ambiguity, use the same identity. Otherwise it looks fabricated."

He closed the laptop.

She had no second surname on any of the tickets. The correction was bait. If the next false record acquired one, she would know the man or whoever received his report had authored it after this flight. A fabricated detail could become a marker when she supplied it herself.

For the rest of the taxi he stared at the seatback. Sofía wrote *invented second surname, 11:52* in the notebook and boxed it. She did not feel clever. She felt the specific disgust of placing a false fact into systems already full of them. But this one had a known origin, a known time and only one listener. If it travelled, it would describe its route.

The plane pushed back into a wind that rocked it on the apron. Through the window the city slid away, the river flat and brown, and Sofía opened her notebook to the page with

the plain sentence written in ink and read it once more, because on Monday night, in a sealed hall at the end of a long road, it was going to be the only thing she had that everyone else in the room wanted her to make bigger.

Chapter 20: The Talud Hall

The guard would admit Sofía Alvarez to the hall but not to its delivery archive.

Lucia read the restriction twice at the inner gate while the Aster Relay delegation waited beside its van. *Archive request requires tenant clearance.* Somebody had separated seeing the machines from seeing how they got there.

"Four visitors," she said, counting them against the manifest on her tablet as they climbed out into the wind. "Two engineers, one counsel, one delegate. Delegate Alvarez, you're with me first. The others go to briefing room two until your appointment."

"I need the intake records," Sofía said.

"Then we start with mine," Lucia said, and signed for the escort.

The delegate was younger than the file photograph and moved like someone reading the ground for tripwires. Lucia had read the file too, all of it, including the pages Talud's own presence system could not explain. She kept that knowledge where she kept everything: in the shift plan, not on her face.

Piedra Sola spread below the ridge road as they walked:

the energy campus first, turbines and switchgear and the maintenance sheds that fed her family, then the newer buildings, then, at the far end, the hall itself. Low, grey, deliberately boring, its roofline broken by heat exchangers rather than anything dramatic. The wind came off the plateau in long steady pushes and the flags on the admin building cracked like whips.

"You're from Bariloche," Sofía said. It was on Lucia's badge, under the name.

"Born there. Educated in Neuquén. Came back because industrial systems have answers." Lucia walked half a pace ahead. "Everything here answers eventually. The trick is asking questions the equipment can survive."

Inside, the hall divided into what the brochure would have called modest compute and what Lucia thought of as the honest part. Rows of ordinary racks, mid-range accelerators by the pallet, nothing frontier, nothing that would make a headline. The instrumentation was the expensive part. Sensors on every circuit, power meters on every socket, environmental telemetry sampled faster than most labs sampled their actual experiments. Talud sold receipts, and receipts required proof of conditions, so the building measured itself the way a jeweller's scale is calibrated: constantly, jealously, against references nobody else was allowed to touch.

Along the far wall, sealed doors in pairs. Behind each pair, a digital twin environment, an isolated replica of some customer's system built to take real attacks without any real world attached. The twins were fictional to everyone outside their walls; even Lucia's access stopped at the doors.

"The targets are confidential," she said. "I don't know what's behind them and neither do you. What I know is

power draw, thermal load and schedule. That's the whole of my visibility, and I'll thank everyone this week not to assume it's less."

"And the witnesses?" Sofía asked.

"The pods run in the small cabinets in the witness corridor. Sealed appliances, one per tenant faction plus independents, each with its own clock, its own printer, its own custody log. They watch the tests through instrumentation feeds only. No exploit contents cross their boundary. A receipt says *a test of class X ran under conditions Y between times Z*, signed, and the buyer trusts it because the required witnesses say the same thing." Lucia stopped at the corridor mouth and looked down its length: eight grey cabinets, status lights steady, printers silent. "That trust is why we're all still employed."

They walked the floor while Lucia did her rounds, and she talked the way she always talked to visitors who asked real questions: about the campus beyond Talud, the legitimate energy-modelling work running normally in the buildings they had passed, the wind farm's maintenance calendar, the crew from Puerto Madryn rewarming a transformer, local objections to truck movements that she had personally taken to Esteban's office. Patagonia worked here. The facility was a tenant inside a working region, and she was the person who made the region and the tenancy hold together.

What she did not put in the visitor version was the payroll meeting two winters ago. The materials lab had lost its largest customer and Esteban had placed two columns on the screen: jobs without Talud, jobs with it. Nine names survived in the second column. One belonged to Lucia's night electrician. Another belonged to the woman who calibrated the hall's airflow sensors and had just taken a mortgage in town. Tenant confi-

dentiality, Esteban had said, was not an abstract virtue when it paid salaries on the last business day of the month.

Nor was Talud the only acceleration on campus. The youngest instrumentation technician used a model on his phone to translate manuals and propose diagnostic sequences for equipment whose manufacturer no longer answered Argentina. He could repair boards Lucia had once shipped to Germany. The oldest machinist had stopped receiving drawing work for guards and brackets because customers generated acceptable replacements from photographs and sent them directly to automated mills in Buenos Aires. He now drove the campus shuttle three days a week and refused to call the change progress or theft. It was simply the fact that his hands were worth less to people who had never watched them work.

Lucia did not have one opinion that covered both men. She distrusted anybody who did. What she knew was consequence: new capability arrived in a week, new procedure in a quarter and new training after somebody found a budget. The gap was staffed by whoever happened to be standing closest when the alarm began.

As if the building wanted to demonstrate, Lucia’s radio called her to the instrumentation shop. The youngest technician, Lautaro, had a materials-lab controller open on an anti-static mat and an assistant translating its six-hundred-page German manual. The translation was accurate, but the proposed repair sequence had dropped the discharge interval printed a page earlier, and Lautaro had already written it into his checklist in red. Lucia told him to go ahead, and the controller came back online without a six-week wait for customs.

On the way out they passed Omar driving the campus shuttle into the maintenance bay. He was the machinist Lucia had been thinking of, broad-handed, sixty and furious at the vehicle's sliding door. The latch bracket had cracked. On his workbench lay the original drawing, yellow at the folds, beside a new bracket cut that morning by an automated shop in Buenos Aires from phone photographs.

The new part fitted perfectly and used half the metal. It also placed a sharp inside corner at the point where the door flexed.

"It'll last six months," Omar said. "Maybe nine. The old one lasted fourteen years."

"Can you alter it?" Sofía asked.

"Of course I can alter it. Nobody asked me to design it. They asked me to drive to the airport while a machine designed it cheaper."

He rounded the corner by hand and welded a small reinforcement along the bend. The work took twelve minutes. The purchasing system recorded no design labour because the bracket had arrived complete. It recorded Omar's time under vehicle maintenance, the lower-paid category.

"People keep saying the tool replaced drawing," he said, cooling the part in air. "It replaced the moment somebody called me before ordering. The hands come back afterwards, when the clever part has already received the money."

Lucia signed his maintenance sheet and crossed out the category. She wrote *design correction* beside it, initialled the change and told him to submit the higher rate.

"Esteban will reject that," Omar said.

"Then he can reject my name."

As they returned to the hall, Sofía looked back through the

shop window. Lautaro was photographing the red warning for the next technician. Omar was fitting the corrected bracket to a shuttle he no longer wanted to drive.

Sofía listened properly, which Lucia noticed and filed away. Most Buenos Aires visitors heard *distance* and stopped listening, assuming emptiness followed. This one asked what the night shift cost, who supplied the diesel backup, how far the nearest hospital was and whether the road closed in September.

At the witness corridor, Sofía paused.

"Can I see the delivery logs? For the replacement appliances arriving before Tuesday?"

"You can see the summary page. Contents stay sealed until custody review." Lucia pulled the tablet up and turned it around. Two replacements scheduled, Saturday delivery, one from Ternhaven's supplier, one through a Morrow Array reseller, both already manifested, both already assigned to Monday night's ceremony.

"Show me the previous delivery," Sofía said. "A month ago."

Lucia did not ask how she knew. She opened the archived intake case, the version Talud had closed as conditioner-related clock skew. The summary contained seal times, courier signature and her countersignature. It did not contain the thermal strips she had kept in her kitchen drawer because she had removed them before disposal and never entered them after the network returned.

"I kept something," Lucia said.

They moved to the intake office, a room with one steel desk, calibrated scales and no comfortable chairs. Lucia took the strips from an evidence envelope she had made herself the

morning after that delivery. No official case number. No chain beyond her name, her kitchen and the locked drawer at work.

"Weak custody," she said before Sofía could.

"Honest custody. Different problem."

They laid the indicators beside Lucia's photographs. Case two's strip had crossed forty degrees before she removed it. That recorded exposure, not a sequence of cycles. The casing measurement on arrival was a separate fact: thirty-one degrees while the other two cases matched the cold annex.

Sofía opened the archived receipt for Lucia's trial. Its observation field read 22:05:02; the target run clock began at 22:14:02. The facility power log placed the appliance's first connection to hall power hours after Lucia had measured it. Nothing in that later session explained its condition at the gate.

"It arrived with history," Sofía said.

"Yes."

"Where did the courier stop?"

The manifest listed origin, destination and total distance, not route. Lucia called the goods-bay supervisor, who retrieved the driver's entry record. He had mentioned a warehouse delay outside Neuquén because another tenant's seal was not ready. The supervisor remembered only because the driver asked to use the toilet while waiting at the gate.

They checked the transport invoice. Four hours of detention billed at a warehouse whose name appeared nowhere in the appliance custody chain.

"Somebody had physical time with the cases," Lucia said.

"Or the warehouse is ordinary and the history predates it."

"You really don't let a useful explanation stay useful."

"Not until it survives being boring."

Lucia called the courier company and requested the vehicle temperature log under the facility's delivery contract. The dispatcher emailed it after twenty minutes. Cargo-bay telemetry, one point every five minutes. The truck compartment held between twelve and fifteen degrees throughout the warehouse stop. The warm case could not be explained by the recorded air temperature alone.

Sofía aligned the vehicle log, gate entry, facility draw and receipt. Four owners, four records. None established where the appliance had run, or whether its battery conditioner had supplied the heat. They did establish an unrecorded condition before site power and an observation timestamp before the target. *Clock skew* did not answer both questions.

"Battery conditioner," Lucia said, reading the old note. "That is what the customer told me, so I wrote it as their explanation and everyone after me read it as my finding."

She amended the intake case. *Pre-delivery heat requires explanation. Conditioner activity not documented. Target chronology disputed.* She attached the courier log and a photograph of the strips, explicitly marking the strips' personal custody gap.

The case reopened automatically. Talud's system notified the customer and scheduled a response within one business day, which meant after the replacements arrived and before the ceremony.

"Now they know what we'll inspect," Sofía said.

"They already knew. They sent the explanation before I asked the question."

The reopened case changed the following morning's delivery from routine intake to contested custody. Neither woman had discovered where the appliance ran. They had done something less satisfying and more useful: made the convenient ex-

planation answerable to a record.

Something crossed the visitor's face that Lucia recognized from her own mirror: the look of a person reading a document and finding one line missing from where it should be.

"Problem?"

"Your ceremony is scheduled to finish at midnight into Tuesday," Sofía said. "The auction settles Tuesday evening. Those are very close together for a root migration that size."

"They are," Lucia agreed. "I've asked twice why the window is so tight. Both times I was told settlement drove the date." She put the tablet away. "I don't like answers I can't check against a purchase order. But that's Tuesday's problem, and today I have a transformer to collect."

She left the delegate at briefing room two with the rest of the Aster Relay party, nodded to the corridor guard, and went out into the wind to do the part of the job that had answers. Behind her the hall hummed, measuring itself, and eight witness cabinets stood in their corridor printing nothing yet, holding their clocks like held breath.

Chapter 21: Warm on Arrival

The replacement appliances arrived Saturday at 09:20, two hours before their manifested window, which was the first thing Lucia wrote down.

She met the courier truck at the goods bay with the custody log open and made the driver wait while she photographed the seal positions, the case serials and the truck's temperature dashboard, in that order. The driver, a contractor from Neuquén who had delivered here before, waited with the patience of a man being paid by the hour.

"Two units," he said. "Signed manifest. One for your Ternhaven channel, one through a reseller, don't ask me whose."

"I'm not asking," Lucia said. "I'm weighing."

Because that was the second thing: the intake bench scale. She had checked it against reference weights on Thursday. A sealed witness appliance with its battery conditioner weighed eleven kilograms and four hundred grams, plus or minus the mass of the desiccant pack, and she had the certificate on her clipboard to prove it. The left-hand case weighed heavy. Not much. Two hundred grams, maybe three. The right-hand case came off within spec.

She carried both into the intake room alone, per procedure, and began the examination she had performed once before in this building, a month ago, on a delivery nobody had thought important.

Filters first. The release sheet recorded clean filters after factory testing. The left-hand unit's intake filter held dust. Not much of it, but Patagonian dust was fine enough to get everywhere. Under her loupe it was grey-pink and dry. She could describe it, not identify a warehouse or date its arrival. It contradicted the documented filter condition. That was enough to record.

The desiccant pack came out swollen, its indicator beads turned from orange to green, heavy with water it had drunk somewhere warmer and wetter than a sealed crate. Alone on the bench scale, it made up most of the difference.

Battery cycles next. The conditioner logs its own charge history to internal storage, tamper-evident but readable through the service port without breaking the seal. The left-hand unit reported four complete conditioning cycles since manufacture. The right-hand unit reported one. Neither number proved anything alone. Together with everything else they were beginning to compose a sentence.

Coolant residue. She pulled the inspection port and looked for the faintest trace of thermal paste displacement, condensation marks inside the housing, the ghost a heat sink leaves after it has cycled hot and cold. The right-hand unit was clean. The left-hand unit showed residue bloom on its cold plate: consistent with heat and cooling. It did not tell her which workload had run, or distinguish testing from illicit use.

Then the appliance's own thermal wax: a small pellet in its custody logger, calibrated to melt at fifty degrees, a physical

fuse against exactly the lie she was holding in her hands. The thermal strips she had cut from the crate lids a month earlier recorded threshold exposure. This pellet answered a narrower question. If the unit exceeded its rated transport temperature, the wax flowed into a catch channel and no firmware could reset it.

The left-hand unit's wax had flowed.

The right-hand unit stayed cold and clean through every physical check. That did not make it honest. It made it a different question.

Lucia connected the service reader again and opened the custody counters, values the appliance exposed without revealing test contents. A new unit arrived with a factory self-test at counter zero, transport conditioning at counter one and its first witness action after intake. This unit showed transport conditioning at one and a signing counter of twelve.

No receipts were visible. The signing counter was held inside the secure element and could only move when the device signed a witness envelope. It could not be reset without destroying the tenant key. Eleven signatures existed somewhere inside a machine whose seal said it had never entered service.

She checked the certificate against the manifest. Correct serial. Correct tenant key. Correct factory signature. Nothing substituted.

She called the supplier's service number from the wall phone and identified herself, the site and the custody case. The first technician said the counter included quality checks. Lucia asked for the factory release sheet. It showed one quality signature, counter zero to one, before tenant-key injection. The technician transferred her to a supervisor.

The supervisor said pre-provisioning was permitted under

the reseller agreement.

“Provisioning does not increment a witness-signing counter,” Lucia said.

“Some customers stage envelopes before shipment.”

“An envelope for what?”

“Scheduled capacity. No test content. The signatures become effective only when matched to a run.”

“So the device signs eleven statements before the run and the market decides later which statements became true.”

“That is not how I would characterize it.”

“I am not asking for characterization. I am asking whether counter twelve can exist without eleven tenant-key signatures.”

The supervisor requested time to consult compliance. Lucia gave him the intake case number and told him the unit would remain quarantined. Before the call ended, he said, “Your facility accepted staged envelopes last quarter.”

“Which facility officer accepted them?”

He would not say over an unverified line.

Lucia wrote down his exact words, the call times and the number displayed on the wall phone. She photographed the counter beside the intact seal. One appliance carried physical history it should not have. The other carried signatures it could not yet have earned. Warm inventory and cold inventory, arriving together for the same root.

She sat back on the stool and looked at the two cases for a while. One clean, one warm. Ternhaven’s supplier and a Morrow Array reseller, each side sending its own pre-run appliance to Monday night’s ceremony, each assuming the other’s shipment was honest. A month ago a warm appliance had arrived here by accident or arrogance and certified a trial nine

minutes early, and everyone had called it clock skew. Now the two practices lay on her bench side by side, sent openly, as if the market had already absorbed forward-made witnesses and only the physical method remained negotiable.

She wrote the findings into the custody log in her flat engineer's hand: filter dust, cycle count, residue bloom, wax state, secure signing counter, call times and initials. Then she signed it, because a finding you will not sign is a rumour.

Esteban found her there at noon. He read the log standing up, twice.

"You can reject custody," he said. "You know what that means."

"I know what missing the ceremony means." Lucia closed the log. "If Tuesday slips, Talud breaches the settlement schedule, the auction collapses, the tenancy revenue goes with it, and the campus loses the budget line that keeps the legitimate labs running through winter. I can count. That's most of my department."

"And yet you've written this down."

"Because it's true, and because I'd rather be unemployed than complicit in a receipt." She stood. "I'm not rejecting custody yet. I'm quarantining both units pending ceremony review, and I'm telling you now so you hear it from me and not from a lawyer."

He rubbed his eyes. For a moment he looked every year of his age and then some, an energy executive who had sold tenant confidentiality as infrastructure and was discovering what else came bundled. "There's something you should see," he said finally. "In procurement. Since you're the one writing things down."

The facilitation fee sat three folders deep in the facility's

records, dated five weeks back, paid to a scheduling consultancy in Buenos Aires that owned, as far as Lucia could tell, a laptop and a post office box. The invoice line read *window alignment services*. The amount was obscene for consultancy and modest for what it bought: confirmation, buried in a routine amendment, that the root ceremony would open its window at the hour the largest auction needed it to.

It explained why the window sat so tight against settlement, and why Esteban had been told *settlement drove the date*.

"The board will want my head for showing you this," Esteban said.

"The board can want," Lucia said, photographing the invoice. "It's dated. It's signed. It exists. Everything else this week is somebody's story about the future. This is a purchase order for the past."

Back in the intake room she locked both appliances in the quarantine cage, logged the cage key into the safe, and stood a moment listening to the building hum around its secrets. Two machines, warm and cold, waiting to be asked on Monday night what they had witnessed. She knew their whole biography: filters, cycles, wax. Nobody had needed to hack anything. You just had to be the person willing to weigh the crate.

Chapter 22: Human Witness

They told her Martin was alive on Saturday afternoon, and let her see him that evening, in a converted storeroom at the back of the admin building with one window, a cot, a desk covered in printed chronologies and a guard outside who played a word game on his phone.

Ternhaven protection, the escort said, as if the phrase explained the lock on the outside of the door. Sofía supposed that from certain angles it did.

The room contained evidence of the distinction Ternhaven wanted her to make. The cot had clean sheets. Martin's medication sat in a labelled pharmacy bag. The desk held food, paper and two sharpened pencils. The window opened four centimetres, enough for air and not a body. On the wall beside the door, a printed schedule gave him three calls a day, two escorted walks and one hour without observation except for the camera over the exit.

"They treat you well," Sofía said.

"They document treating me well. That's not the same sentence."

His afternoon call had ended when she arrived. A tablet

still showed the blank screen of a disconnected family account. Ternhaven permitted him to speak to his daughter through an intermediary, never directly to the school system Morrow Array had touched. Calls were recorded for his protection. The child had learned not to ask where he was because every adult answered differently.

“Today she told me her class is building bridges from paper,” Martin said. “She made the strongest one and the teacher asked whether someone helped.”

“Did someone?”

“A tutorial. She watched it twice and changed the design. She asked if that meant the bridge wasn’t hers.” He looked towards the guarded door. “I spent a year arguing about that question for software and couldn’t answer it for a nine-year-old without hearing every position I hate. I told her it was hers if she could show what she changed and why. Then I wondered whether I had just invented disclosure rules because my daughter wanted praise.”

“It was still a better review than Talud gives.”

“Yes. She had to explain the fold.”

The guard knocked once and opened the door without waiting. He counted the printed pages on Martin’s desk, compared the number with a line on his clipboard and left. No search. No accusation. A custody check, performed politely, establishing that nothing had moved without Ternhaven knowing.

Martin waited until the latch settled. “The first two days I called this protection because Morrow Array had reached her. On the third I asked to leave. They showed me the school recovery attempts and said the route was unsafe. On the fourth I asked what would make it safe. They said settlement. That’s

when protection acquired a price."

"Have they asked you to sign?"

"Not once. They ask me to remain available. A human witness kept in good condition, ready to agree when the right question is eventually asked."

Martin looked thinner and bearded and completely awake, the way he looked during a long incident, except that incidents end. He saw her expression and raised a hand before she spoke.

"Before anything else. Yes, I know how it looks. Sit down. I have about twenty minutes before my keepers decide we've had enough reconciliation."

"You disappeared."

"I was taken." He said it flatly, without theatre. "After I tried to sell the mixed record twice, once to each side, Morrow Array went looking for pressure points. They found my daughter's school account. Recovery path, password reset, attendance portal, the whole ordinary apparatus of a nine-year-old's week. No threats. Nothing a police desk in Toronto could act on against a company in another jurisdiction, and every report I filed would have told Morrow Array how much I knew. Just her schoolwork suddenly visible to strangers, and a message that her safety was my responsibility now." He turned a page of his chronologies. "So when Ternhaven offered protection, I got into their car. Protection and captivity turned out to share a vehicle."

"There's a provincial police post on the regional road."

"And the first officer who writes this down creates a record every party with standing can request, and both companies have standing by breakfast. I got into the car willingly. The lock is for my protection. Until the record sits with someone

neither side owns, a report makes me a liability to both of them at once. The day it does, I'll call them myself."

"And the mixed record." Sofía sat opposite him across the desk. "Tell me what it is, exactly."

"A continuity file. Everything I witnessed honestly for fourteen months as a Talud human witness, cross-referenced against everything I could prove about both frauds. The pre-minted receipts. The warm appliances. Inspeximus's derivative labels. Murmur's variant laundering. And the crossings, where both sides' fabrications met and certified each other." He pushed one of the printed chronologies towards her. "I built it because exposing either side alone would just hand the market to the other. Both at once, or neither. Mutual assured disclosure. It was elegant."

"Was."

"It failed," Martin said, "because I tried to sell it. Twice. That's the part of me you're allowed to despise. I found the worst thing happening inside the only market I've ever trusted, and my first instinct was to price it. I told myself neutrality needed funding. I believed myself for almost six days." He looked at his hands. "You were at my handover, the last good week. Ask me why the record is still intact and the answer is embarrassing: because nobody would meet my price, and because every day it sat unsold it became less a product and more a testimony. I'm not going to pretend the second motive arrived first."

Sofía read the chronology page while he watched. His work, unmistakably: the same care he brought to library maintenance, timestamps reconciled across four clock systems, every claim sourced, every uncertainty marked. In another life it was a changelog.

"I read the Nadia Ortiz thread," she said.

His face changed more than it had when he described the locked door.

"Then you know the part of this that doesn't fit into either side's deck. Her assistant was wrong about the cause. She was right about the failure. I rejected both because forty reports before hers had trained me to recognize confidence as waste." He turned one of the pages over, blank side up. "After we fixed it, people sent the thread back to me as proof I should accept everything. The next week we received ninety-three reports. One was real. I spent my daughter's Saturday finding it."

"And your other maintainer left."

"For a month. Then for good." He said it with the restraint of somebody naming a death outside the family. "She got an internal job maintaining an inventory system nobody can submit reports to. Better money, closed queue. NamedWitness lost the only person besides me who understood why half its ugly decisions were made."

"So you became a Talud witness."

"Yes. Because suddenly the market paid for the exact thing the commons expected for free: my ability to look at a polished claim and know what question would make it fall over. I told myself the boom had not displaced me. It had discovered my price." He looked around the locked storeroom. "That story was true for almost a year."

The guard outside made a word and the game chimed approval.

"What changed?" Sofía asked.

"The volume. At first I read every sealed report. Then I read the reproduced effect and sampled the path. Then I read the evaluator summary and checked the exceptions. By spring

the summaries were written by one system about work done by another system and my job was to decide whether the disagreement score looked human enough to deserve my name." He rubbed his eyes. "I am very good at this, Sofía. Better than most people Talud could have hired. I still could not keep up. That's the humiliation nobody markets. Expertise doesn't make the day longer."

"Why keep signing?"

"Because every so often the queue produced Nadia. Something real, strange and important that no human had noticed. Refuse the system and I bury her again. Accept the system and I spend the commons one report at a time. There was no clean sceptical position left, only different ways to ration attention." He tapped the chronology between them. "So I built this. One record that would force both factories to slow down long enough for a person to read. Then I put a price on it, because apparently I learn the shape of a trap faster than I learn not to enter one."

"The crossings are the spine of it," he said. "Neither side can expose the other without self-incriminating. That symmetry is why everyone's still standing. But there's a hole in it, and the hole is why they let you in here, and why they'll both be polite to you until Monday night."

"The hole being?"

"They need your signature. Not mine. Mine is compromised; both sides have known since they started paying me. Yours is clean. SRE of record on the original incident, operator of the Paraná node, name already on Talud's witness list since April through channels I'd swear neither faction fully controls. If Sofía Alvarez validates the mixed record, it stops being Martin Vale's ransom note and becomes evidence." He leaned for-

ward. “And yes. I am asking. My daughter’s safety depends on both factions fearing this file’s release. Your name makes the fear credible. That’s the whole ask, and I hate every clause of it.”

“What happens to the fear after Monday night?” Sofía asked. “If the ceremony runs and the mixed history joins the new root, does releasing your file even matter? The fraud becomes permanent infrastructure. Nobody’s scared of a testimony about the past once the past is load-bearing.”

Something moved behind his eyes that she recognized: the maintainer’s shame of having missed the obvious issue until review. “The window closes either way,” he said quietly. “Which means my leverage has a shelf life regardless of what you do. So I’ll tell you the other thing, the one I should have led with.” He took a breath. “Don’t validate the whole record. Validate nothing you haven’t personally checked. I built it honestly, but you can’t know that, and your strength this week isn’t believing people. It’s intervals. Prove the impossible interval and let the record stand or fall on its own. If both factions watch you refuse to endorse it, the file gains more credibility than any signature could give it, because it will be the only thing left that nobody owns.”

“That doesn’t get your daughter clear.”

“Not by itself. On today’s call I asked her mother to close the school account and move her. Recorded, every word. Nobody protecting a child can object to her being made safer without saying out loud what she’s for. But this gets Tuesday honest, and honest Tuesdays are the only kind that ever made markets safe enough for people like her.” He began squaring the chronologies back into their folder, hands steady, workmanlike. “Twenty minutes is nearly up. The escort talks, so I know

about this morning. Tell Lucia I said the wax test was well done. Tell Agustin's mirror, if it survives, that its archive was right about the fork dates. And tell yourself, before someone in a bad suit asks you to sign something satisfying on Monday night: you've already written down what you can prove. Read it out loud. Nothing more."

At the door she stopped, hand on the frame.

"The mixed record. Where is it?"

"Three copies," Martin said. "Held by people who don't trust each other or me. Your Paraná quarantine notice says *images taken*, and nobody who writes that keeps one copy. Ternhaven prints me every federation notice. I just did it first, worse, and for money. One of mine sits with the federation's outside counsel in São Paulo, a disputes firm that answers to neither of them." He almost smiled. "Go on. You have a quorum to break."

Chapter 23: The New Market

The settlement floor occupied the east wing of the hall, behind glass, and Sofía walked it Sunday afternoon on her legitimate delegate badge while the ceremony crews tested cables around her.

Talud's product was receipts, but receipts were only the certificate. The market lived here: rows of terminals where brokers for buyers she would never see reviewed packages, bid and hedged. Screens showed lots she was not cleared to read, redacted to class labels and price movements. She kept to the visitor rail and did what she had come to do: look for one name.

She found it at 16:40 on a pending-settlement board, in a package labelled with a class-two finding and a buyer code that resolved, through nothing more secret than the hall's public rate card, to a European integrator. The package carried an evaluation attestation. The evaluator of record was Micaela Ferreyra.

Micaela, who ran delivery routes in Balvanera and Almagro. Micaela, whose honest evaluation work Mateo had noticed and praised, and whose name now sat, printed and pend-

ing, under a sale she had never seen, in a building more than a thousand kilometres from the streets she actually knew. Someone had lifted the attestation from Morrow Array's contributor records, where Micaela's evaluation improvements were logged and dated, and stapled her competence to someone else's inventory. Her work as a human sticker on another entity's sale.

Sofía photographed the screen with her personal phone, timestamp visible, badge in frame, because evidence you might need later deserved boring metadata.

Then she left the floor and called Micaela.

The only place in the east wing where a delegate could speak without becoming part of the brokers' soundscape was a service stair between the settlement floor and the loading corridor. Sofía sat on the concrete step with her badge turned inwards and listened to the call ring through the noise of Balvanera. Motorbikes, a shutter, somebody calling out an address. The ordinary machinery of the business whose owner was being sold here as an evaluator.

"I have ninety seconds," Micaela said. "The app has put every rider west of Pueyrredón into the same zone and I have six people arguing with a map."

"Did you evaluate a security package numbered 4471-C?"

The noise on the line changed. Not silence. Micaela had covered the microphone and walked somewhere else.

"Where did you get that number?"

"It's on a settlement board at Piedra Sola. Your name is under it."

"My full name?"

"Yes. Evaluator of record."

Micaela said nothing for five seconds. Then: "Read me the

date.”

Sofía did.

“No. That week I tested route reconciliation. Mateo sent me a queue with broken orders and asked which ones the tool recovered. I marked pass, fail or couldn’t tell. That was all. There was no security package.”

“What did you agree to when you joined the queue?”

“A contributor page. Payment per completed evaluation if they used it. It said results might be aggregated.” Her voice had acquired the flat speed Sofía remembered from the repair workshop, the voice of a woman keeping panic from becoming another task. “I read it. I thought aggregated meant they would add my pass and fail counts to everyone else’s. I didn’t think it meant my name could travel.”

“Did you sign an attestation?”

“I clicked a box.”

“What did the box say?”

“Something about reviewing the submitted material.”

“Which submitted material?”

“The queue.” Micaela stopped. Behind her a rider asked whether Congreso was east or central tonight. She told him east, wait for the refresh, then returned to Sofía in a lower voice. “There were forty-seven tasks. You opened one, the tool gave you a proposed answer, you tried it against the dispatch twin and marked the outcome. Most failed for stupid reasons. Wrong street ranges, old invoice rules. One worked when I didn’t expect it to. After that I kept going.”

“Why?”

“Because one worked.”

The answer came with enough shame that Sofía did not ask twice.

Micaela continued anyway. “You don’t understand what those queues feel like. Thirty wrong answers and then one catches something I missed, and suddenly the next one might be the useful one. So you run five more. Then you’re already late and the work is still there and maybe one more repairs the hour you lost. They paid only for accepted evaluations. I never knew which ones were accepted until the dashboard told me. Sometimes money appeared a few days later. Sometimes nothing.”

Variable reward, Sofía thought. Not incompetence. A slot machine built out of piecework and professional hope.

“Do you still have the original queue records?”

“The tablet has history. The workshop took an image when they repaired it.”

“Don’t update it. Don’t clean it. Don’t open the contributor page from that device again. Ask Agustin for a read-only copy, and write down what you just told me while the dates are in front of you.”

“Am I in trouble?”

Sofía looked through the stairwell’s wired-glass window at the settlement floor. Package 4471-C had moved one row higher while they spoke.

“Your name is in trouble,” she said. “I don’t know yet whether the rest of you is.”

Micaela breathed out once, hard. “That’s not funny.”

“It wasn’t meant to be. I need you to do one thing I should have asked in the workshop. Tell me the boundary of your work. Not what Mateo said it might become. Not what the contributor page called it. What did you personally do?”

This time Micaela answered slowly.

“I supplied delivery failures from my own system after re-

moving customer details. I ran proposed fixes against a copy. I marked whether the copy behaved better. I did not inspect how the fixes were made. I did not test security. I did not see package 4471-C."

"Write exactly that. Date it. Send one copy to yourself and one to Agustin."

"And one to you?"

"Not yet. Yours first."

A refresh alarm sounded on Micaela's side. The six riders had become her life again. Before she hung up she said, "Sofía, the one that worked really did work. It found duplicate jobs we were paying twice. That part is true."

"Write that too."

The call ended. Sofía returned to the rail and made herself look at the whole board, not just one name, because the whole board was the actual discovery.

Around Micaela's line, filling every queue and waiting list, the excluded operators' work was everywhere. Findings from researchers priced out of Ternhaven's human-provenance premium. Results from small teams running open models on rented hardware, exactly the collective Mateo drove hardware towards. Genuine findings, several of them, if the class labels meant anything: real flaws found by people the market called noise, queued for review that would never come because no human reviewer existed whose time they could afford.

At the end of the rail, a public terminal offered delegates a demonstration of the new settlement interface. Sofía selected a package already marked ineligible, one with no price-sensitive details left to hide. The submission had come from a refrigeration technician using a rented open model to inspect controller firmware. The model proposed an unsafe command sequence.

The technician did not know the name of the memory error it triggered, but he knew compressors and had noticed the pressure relay staying closed after the safety process thought it had opened. He filmed the gauge, copied the command and wrote, in plain Spanish, *this should not still be climbing*.

The interface converted his account into market language. Potential out-of-bounds write. Probable remote actuation. Reproduction incomplete. Submitter expertise unverified. Human provenance absent. Below the summary, a red bar showed why the package had failed: no accredited reviewer within its price band.

A broker waiting for the next terminal watched her read it.

"The assistant says it is probably a duplicate," he said in English. "The same controller family had two claims last quarter."

"Did either claim include a pressure relay?"

He shrugged. "I don't read firmware. I price evaluator disagreement."

"Then who reads it?"

"If disagreement crosses the threshold, a specialist."

"And if both evaluators learned from the same earlier claim?"

He smiled as if she had asked whether weather models shared rain. "Then they agree."

Sofía opened the two prior summaries. The first described a network packet that reset the controller. The second was a generated variant of the first. Neither mentioned pressure, a relay or a command path that survived the safety process. The new package had been labelled derivative because its software name matched, even though the submitter had noticed the physical fact the prior reports never measured.

“He may have found a different failure,” she said.

“He may have. He may also be a technician who prompted a model until it scared him. We cannot buy every alarm from every person with a video.”

That was true. Talud could not replace expertise with sincerity. The gauge might be misread, the relay already faulty, the command unrelated. The technician’s lack of vocabulary did not make him wrong, but neither did his proximity to a machine make him a security researcher. Someone still had to do the expensive middle work.

“What would review cost?” she asked.

The broker touched the estimate. A number appeared that exceeded the package’s maximum bounty by a factor of six.

“And if it were submitted by an accredited lab?”

He changed the provenance selector. The estimated review cost fell below the bounty because the system sampled accredited evidence instead of reproducing it in full.

The same claim became economical when attached to a name the market already trusted.

“That’s not bias,” the broker said. “That’s prior performance.”

“It can be both.”

He had no argument with that. He only needed a price.

She checked the package history. The technician had appealed twice. His first appeal was four sentences, careful and concrete. His second had been rewritten by an assistant into polished security language. That one scored lower because its phrase overlap with previous reports looked generated. The tool had helped him speak the market’s dialect and, by doing so, made the market trust him less.

There was a contact boundary, consent to technical ques-

tions through a relay. Sofía typed one: *When the gauge continued climbing, was power present at the compressor or only pressure stored in the line?* The system warned that she was not an assigned reviewer and her question would not affect eligibility. She sent it anyway under her delegate name.

The answer came eleven minutes later, during Noa's approach along the rail.

Power present. Clamp meter in video at 02:14. I did not know that mattered. I can repeat with a second controller if someone pays for the damaged relay.

Sofía watched the video at the marked time. A meter in the lower corner showed current after the safety process reported shutdown. It did not prove a software vulnerability. It proved the rejected submitter had observed the right next fact without knowing its professional name.

She attached the timestamp to a request for physical review and committed it to the public queue. The red bar did not move. Her legitimate delegate badge gave her permission to ask a better question, not money to have it answered.

The market had found a way to let almost anyone discover something and a different way to ensure only established people could finish discovering it.

Noa appeared at the rail beside her without ceremony, hands in pockets, reading the same board.

"You're looking at your friend's name."

"I'm looking at all of it," Sofía said. "There's real work in those queues. Some of it is good. You'd call it contaminated by origin."

"And Mateo would call it valuable by result, and neither of you is wrong, and neither position survives contact with that screen." Noa nodded at the board. "Look what access has be-

come. Not knowledge. Placement. A name in the right queue is worth more than a flaw in the right software. Everyone down there is buying and selling the right to be believed." She said it without satisfaction; there was no satisfaction available to her in being right this way. "Ternhaven built its premium on refusing this floor. And here I am, standing on it, because my alternative is watching the whole idea of provenance die inside a root migration we can't stop either."

"Then help stop it."

"With what? A purge?" Noa turned to face her fully. "You want me to say it out loud, so let me. If Ternhaven could reach into that board tonight and strike every model-originated claim, every assisted evaluation, every ambiguous authorship, we would. You know it. It wouldn't save the market; it would just make our exclusion permanent and profitable." A pause. "And you won't hand us the knife either, will you?"

"No."

"Because it can be spun."

"Because it's not mine to sign." Sofía said it evenly, in English, formal. "Micaela's attestation can't describe anything she did. That's provable once her records are preserved. Whether every model-originated finding in that queue deserves exposure is not something I know, and I'm not certifying what I don't know. Not for you, not for Mateo, not for the board."

Noa studied her for a long moment, and whatever she concluded, she kept.

"They'll both offer you something tomorrow night," she said instead. "Before the window. Everyone gets offered something before a settlement; it's how settlements stay soft. Whatever shape it arrives in, check which of your accounts

it lights up." She glanced once more at the queues full of unowned work. "The ones nobody offers anything for are usually the truest. Look at them. They can't even get an offer."

She left towards the lounges, exact as ever. Sofía stayed at the rail a minute longer, looking at Micaela's name sitting quietly under someone else's price, and at the queues of findings nobody would buy because their authors lacked the one thing for sale: placement. Access as extraction, operating smoothly, one day before the ceremony meant to make all of it permanent.

She wrote two lines in her notebook, dated them, and closed it:

Package 4471-C bears evaluator attestation M. Ferreyra. Attestation cannot describe any act she performed. Provenance of the attestation itself is now the question.

The middle of the market is people. Both factions are pricing them.

The cable-testing crews finished at six, and the hall settled into its overnight quiet. Before the pending board dimmed, package 4471-C changed state.

ELIGIBLE FOR ROOT COMMITMENT.

At midnight tomorrow, unless somebody stopped the clock, Micaela's stolen name would become money.

Chapter 24: Root

The memory came back complete at midnight, as she had known it would, because she had spent ten days feeding it pieces and the whole of it had been waiting for the last one.

She was in her borrowed room in the guest block, lights off, wind working at the window seal, and she let it arrive.

The Hashcairn job. The last one. Late 2023, three years ago, a rented flat in Córdoba with two desks and one heater. Mateo on his chair by the window, offering her something no client had ever offered: the right to refuse. *We can walk away from this one,* he said. *The cleanup isn't finished and you know what signing an unclean effect means. I'll take the hit with the broker. We'll eat rice for a month.*

And beside the offer, glowing on his screen where he had left it carelessly, deliberately, the way he left every temptation he ever offered: the bonus terms. A Bitcoin payment uplift, expiring at midnight. Not enormous even then. Enormous relative to rice.

The job had reproduced cleanly. That was what memory kept offering as defence.

The sealed twin accepted the test input and produced the expected failure. They reset it, replayed and watched the same effect appear. Two runs, identical outcome, indepen-

dent timestamps. The client did not ask them to see exploit contents; only to certify that a class of effect occurred under a committed environment. Hashcairn was good at that. Sofía was good at it.

Cleanup was a separate pipeline. It rotated temporary keys, destroyed the target image and waited for three storage layers to report that no writable snapshot remained. Two layers completed. The third returned *deletion scheduled* because its retention queue was running forty minutes behind.

“Scheduled isn’t deleted,” Sofía said.

“It will clear before morning,” Mateo answered. “The queue is append-only. We can verify later.”

The broker wanted the receipt now. A timer beside the bonus counted down from twenty-seven minutes. The client had booked a resale window at dawn and priced the extra payment around certainty arriving before competitors woke.

Sofía opened the receipt template. Four clauses: effect confirmed, environment matched commitment, cleanup verified, custody continuous. She could not sign the third. Refusing the entire receipt would erase the two facts she had established and cost them the bonus. Signing all four would convert a scheduled deletion into a completed one.

So she edited the clause.

Cleanup initiated under verified policy; final storage expiry pending provider retention window.

Literally true. Narrow enough to survive. She sent the wording to the broker and received a rejection: standard receipts only. The market required comparable claims. A unique limitation would reduce settlement confidence across the whole package.

Mateo closed his laptop halfway. “We walk.”

He meant it. That was the part she had edited out of the story later. He had already accepted the month of rice. He had not preserved the temptation to force her; he had preserved it because systems of value were most persuasive when visible.

Sofía reopened the template.

The cleanup policy itself was verified. The retention queue had never missed an expiry in their records. If the clause described the process rather than the current state, *cleanup verified* could mean she verified that cleanup would occur. A lawyer might reject that reading. An engineer could defend it. The bonus timer showed nine minutes.

She signed the standard receipt.

At dawn the third layer cleared exactly as predicted. No harm surfaced. The broker paid. Every later retelling used the successful deletion to prove the signature had been responsible, converting an unverified future into a good decision because the future happened to cooperate.

Sofía wrote the final storage timestamp in her notebook and never wrote the hours during which the receipt had claimed too much.

She had signed the effect despite incomplete cleanup because the bonus expired at midnight, and she had told herself the signature meant the test passed and nothing else, and Mateo had watched her do it and said nothing more, and that nothing had been the true beginning of everything between them: he supplied the exits and she chose to stay inside, every time, and both of them called it a partnership until it wasn't.

The memory settled into its place among the other pieces, and she lay in the dark and understood that it changed nothing about Tuesday and everything about her. The midnight signature on her dormant credential, the one Morrow Array

reused, the one Ternhaven's dossiers waved like a flag: it had always been hers. She had lit it herself. Everything since was people finding the light.

The knock came at 00:40.

Not the door code knock of facility staff. A visitor's knock, hopeful, which in a locked building meant someone had talked their way past reception. She dressed, put the notebook in her pocket out of pure habit, and opened the door on Noa, alone, holding a folder like a peace envoy.

"Five minutes," Noa said. "Then Mateo gets his five, then Martin's record gets its five. They're scheduling your conscience down the corridor. I asked to be first so you'd know what the baseline looks like."

"Ternhaven's offer."

"Ternhaven's offer." Noa sat in the desk chair without being asked, laid the folder on the bed, and did not open it. "Full legal regularization of the Banca Roveda account. Real counsel, real filings, applications for any lawful relief still available, negotiated settlement where no relief remains. Your exposure ends. In exchange: your witness signature tomorrow attaches to human-provenance receipts only, and Ternhaven preserves its premium through the transition." She paused. "That's the honest version. Here's the version you should hear from me before you hear it from anyone else. If you sign that folder, you become a line in our settlement records. Human-witness Alvarez, retained, regularized. The day Ternhaven needs someone credible to certify that its inventory is clean, there will be a document saying we own your judgment."

"You're telling me not to sign."

"I'm telling you what signing means. There's a difference, and it's the only difference I have left." For a moment the ex-

actness slipped and something older looked out. “I came into this market believing custody could be kept. I still believe it. What I’ve stopped believing is that our company is the keeper. Sign nothing tonight, Sofía. That’s my actual advice, free of charge, against every instruction I was given.”

“Then take the folder.”

“I can’t. Delivery is logged. If I remove it, someone replaces me and brings you a cleaner liar.”

Noa opened it after all.

The offer was not a vague promise of help. It contained draft disclosures for the foreign account, a list of tax years, penalty ranges and a letter from an Argentine lawyer accepting a retainer already funded by Ternhaven. A separate page described bank cooperation without naming Rina. Another offered a bridge loan against the Bitcoin if the authorities froze it during regularization. Every ugly uncertainty that had kept Sofía awake for three years had been converted into a numbered workstream with an owner and a deadline.

At the back was the witness agreement. Its first page said she retained independent judgment. Its sixth permitted Ternhaven to cite her participation as evidence that human-origin inventory had received independent review. Its eighth required her to give Ternhaven first notice of any contradictory evidence for two years. It did not buy a lie. It bought the order in which her truths could arrive.

“The lawyer is real?” Sofía asked.

“Yes. Not house counsel. Good, expensive and already briefed. If you call the number now, a person will answer.”

Sofía called from the room phone so the contact did not enter her mobile history. A tired woman answered on the third ring and identified herself by name, bar number and the ref-

erence printed in the folder. She knew the account years and nothing about the ceremony. She said the voluntary disclosure route was uncertain but viable, and that delaying another week would not materially change the tax position.

"Has Ternhaven instructed you to withdraw if I refuse its witness agreement?" Sofía asked.

The lawyer went quiet long enough to consult something. "My retainer covers an initial opinion regardless of the agreement. Further representation is funded on execution. I can continue independently if you assume the fees."

"How much?"

She gave a number. It was less than the account and more than Sofía could pay without touching it.

Sofía thanked her and hung up. The help was genuine. The dependence was genuine. Ternhaven had not hidden either one, which made refusal feel less like integrity than waste.

Noa closed the folder. "This is how good institutions recruit decent people. They solve the problem first."

"And then keep the receipt."

"Always."

She left the folder closed on the bed and went.

Mateo's knock came at 01:15. He didn't sit. He stood in the doorway with his jacket on, road dust still on his boots, and made his pitch from the threshold like a man who knew better than to bring cargo into the room.

"One-time keys," he said quietly. "Enough Bitcoin to close every exposure you have, tonight, before the ceremony. And in exchange, all you do is receive. The raw publication goes out under Morrow Array's disclosure framework at dawn: every crossing, both frauds, everything Martin found plus what we confirmed. Talud's market collapses under its own paperwork.

No signature of yours anywhere near it. You just stop being blackmail-able, and the truth comes out regardless of anyone's premium."

"And the wallet that receives your payment," Sofía said, "becomes a wallet Morrow Array can trace forever. Wired into your ledger the moment the coins move." She watched him not deny it. "You'd make me clean by making me yours."

Mateo put the silver key case on the floor between them and opened it. Inside were three hardware wallets, still wrapped, and a printed ceremony of his own: derivation steps, recovery shares, an address for each legal exposure. He had done the work. The amounts were sufficient, the fees allowed for, the paths short enough that even Sofía could verify them against the public chain.

"No contract," he said. "No first-notice clause. No use of your name. I send, you receive, and at dawn the disclosure framework publishes the source bundle to mirrors we don't control."

"Who decides what is in the bundle?"

"The framework scores corroboration and strips unsafe identifiers."

"Who decided its thresholds?"

"We did. Reviewers, maintainers, affected vendors."

"When?"

"Over the last year."

"Before or after you knew which evidence would pass?"

His jaw shifted. "Both. That's what iteration means."

She took his printed address list to the desk and entered the first address into the public explorer. The browser drew relationships because relationships were what Morrow Array's tools did best. The funding wallet touched a disclosure

bond, which touched a hardware grant, which touched three researchers and a small exchange. Nothing criminal. Nothing hidden. A beautiful transparent map of everybody who had once accepted help.

"Now enter an amount," Mateo said. "Any amount. The privacy routing changes the graph."

"It changes the visible graph. You still know the route."

"The software knows it for minutes. I don't."

"You know you paid me."

"Yes. I cannot make a payment I don't know I made."

That was the limit of his freedom doctrine, small enough to fit in one room: somebody still initiated the transfer. Somebody could still say *we helped her* later, and the fact would be true even if every key was destroyed.

Mateo picked up one wrapped wallet and held it out. "You can take these and refuse the money. Generate your own keys. Use the devices for your evidence."

"Then the gift is the account."

"Everything is an account to you."

"Tonight, yes."

"I'd make you safe."

"You'd make me a line item," she said. "My evidence published in a bundle your framework scored, the same week your wallet paid me. Every reader after that gets to ask whether the money bought the score, and they'd be right to ask. That isn't safety. That's my name laundered through your thresholds." She put the wallet back in the case. "And you'd make me early. It's the same mistake as everyone else's, Mateo. Certifying tomorrow before it happens. Dawn doesn't need your help arriving, and I don't need to pre-mint my innocence."

He stood there a moment longer, and she saw him actually

hear it, the doctrine he had driven south inside a rented pickup arriving home to its owner. He nodded once, said, "You froze the wrong card, back then. You never freeze the wrong thing now," and was gone down the corridor.

Martin's offer arrived last, at 02:30, and it arrived as it had arrived in the storeroom: the mixed continuity record, needing only her validation to become credible, needing exactly the endorsement she had already decided she could not give. His messenger was a tired Ternhaven escort who clearly wished to be anywhere else.

The record came in a sealed paper envelope. Across the flap Martin had written one sentence: *I consent to disclosure of the contents under the conditions on page one.* His handwriting sloped harder than it had on the old NamedWitness issue threads but the peculiar open four was his.

Page one required two independent readers, the second named: the São Paulo disputes firm that acted as outside counsel to the regional federation. Then full publication if either faction challenged a verified timestamp, and a trust administered for his daughter. Below the conditions was a blank line for Sofía to certify that Martin had transferred the record voluntarily and that its custody remained continuous.

"Were you present when he sealed this?" she asked the escort.

"Yes."

"Was the door locked?"

"The accommodation is controlled."

"Could he have left with the envelope?"

"The route outside is not secure."

"That isn't what I asked."

The escort looked down the corridor before answering.

"No."

Sofía touched the sealed flap. Martin might want every condition on that page. He might have written them himself. A prisoner could tell the truth, and that was precisely why captivity corrupted testimony more thoroughly than a simple lie. It made honest consent impossible to separate from the locked door around it.

"If I refuse, what happens to him?"

"I don't make movement decisions."

"Who does?"

"Movement authority."

An office without a person's name. The escort's badge had a name, though. Sofía read it aloud and asked whether he would sign one statement: he had delivered the envelope from a room Martin could not freely leave.

"That would end my contract."

"Probably."

"And it wouldn't open his door."

"Probably not."

He stared at the envelope, then at the badge he would have to scan to leave the guest block. "I will attest that delivery occurred under the active Madrid protection protocol. The protocol terms are already discoverable to parties with standing."

It was the narrow fact he could afford. Sofía wrote the sentence, and he signed it with the time. She did not sign Martin's custody line.

The escort took the envelope back. At the threshold he said, "He asked me to tell you that refusing is allowed."

"Did movement authority approve that message?"

"They approved delivery conditions on page one. They didn't ask what else he said."

For the first time that night, an offer left the room carrying less authority than it had brought in.

Sofía sat on the bed afterward among three unaccepted futures and did the arithmetic Noa had named without naming it.

Ternhaven's regularization would wire her into Ternhaven's settlement records. Morrow Array's Bitcoin would key a wallet into Morrow Array's traceable graph. Martin's record needed her signature on his custody, which was its own account, opened in someone else's name and balanced with her trust.

What she actually held ran dark and unlit: the Paraná images in Rosario and Microcentro, the notebook sentence, Rina's preserved fraud record, Agustin's spreadsheet, Micaela's name photographed against a badge. None of it paid her. None of it protected her. All of it stayed hers.

She turned off the lamp, and outside the wind kept testing the window seal the way it had all week, patient, certain that everything loose eventually gives, and the building held, and somewhere below in the hall the ceremony clocks counted down towards the hour when someone would ask her, finally, to say only what she knew or everything they wanted.

Chapter 25: Forty-Seven Minutes

The root ceremony opened at 23:07, eleven minutes late, because a lawyer for one of the settling buyers insisted on reading a reservation into the record before anything else happened. Sofía learned about the delay from the schedule feed and used the minutes to walk her route one last time: witness corridor, observation gallery, the narrow stair to Lucia's intake office, where she had permission, in writing, to be.

The contractual shape was simple and unforgiving. Pending settlement, bank leg and stablecoin escrow both, created a forty-seven-minute window at the start of the ceremony during which the new root had to be proposed, witnessed by quorum, and committed. If commitment failed inside the window, everything reverted: receipts unmigrated, auction unsettled, the whole week's inventory stranded in custody limbo while lawyers fed. Forty-seven minutes. Talud's own contracts had built the cage; everyone present was now living in it.

Sofía took her seat in the gallery at 23:04 with her notebook closed on her knees and counted the room. Buyers' brokers behind glass below. Faction representatives in the side seats:

Ternhaven's delegation crisp and unhappy, Morrow Array's delegation relaxed in a way that cost them credibility every time the schedule slipped. Esteban at the facility table looking like a man watching his own collateral. Daniel on the video link from Seattle, small and pixelated on the hall display, entitled under Aster Relay's customer contract to observe and saying nothing yet.

And in the witness corridor, visible through the interior windows, eight grey cabinets and their custody teams, plus the two quarantined replacements in their cage, standing under seal exactly where Lucia had locked them.

At 23:05 Martin rose from the observers' row, handed the ceremony clerk a sealed sheet and waited while he stamped the time across the flap and dropped it into the tray of sealed instructions unread. Neither delegation looked up. A witness under protection filing paperwork was the most ordinary thing in the hall.

The first pressure arrived at 23:11, before the root proposal had even been read.

Two custody teams approached the quarantine cage with paperwork: an amended ceremony manifest adding the replacement appliances to tonight's witness pool. The amendment cited the settlement schedule's force majeure clause. Behind them came three people in suits whose badges were new enough to gleam, and a facility security officer who kept looking at his shoes.

Lucia was already there. She had been there since 22:50, which told Sofía that her route-walk had been matched step for step by somebody.

"The custody review is open," Lucia said, not moving from in front of the cage. "Both units are under my quarantine,

logged, sealed, photographed. They join the witness pool when custody review clears them or when the director overrules me in writing. Not by amendment."

"The settlement window," one of the suits began.

"Is forty-seven minutes long and none of my concern." Lucia held out her hand. "Give me the amendment. I'll file it with my findings attached."

The finding went into the record at 23:14, read aloud by the ceremony clerk because Lucia insisted: filter dust, battery cycles, coolant residue and flowed thermal wax in one appliance; eleven pre-delivery tenant signatures in the other. The gallery went very quiet. Ternhaven's delegation discovered urgent interest in its own papers. One of Morrow Array's representatives asked, too loudly, whether wax calibration records were even admissible, and the clerk, to his eternal credit, said everything was admissible, this was a custody hearing wearing a ceremony's clothes.

The first proposed compromise arrived at 23:16. A buyer's lawyer suggested the two units be admitted provisionally, their signatures counted for the ceremony and their physical custody questions deferred to audit. No history would be destroyed, he said. Settlement could proceed, and any affected payment could be held back.

It was elegant in exactly the way dangerous proposals were elegant under deadline. Count the evidence now, decide later whether it deserved to count.

"A provisional witness is not a witness category," Lucia said.

The lawyer pointed to the force majeure language. It permitted reasonable substitute controls where scheduled equipment became unavailable.

“The equipment is available,” Lucia said. “It is in that cage. The problem is what it did before arriving.”

A Morrow Array representative proposed counting only the cold unit. Ternhaven immediately supported excluding the same unit and admitting the warm one after recalibration. For ten seconds both factions argued openly for the physical method that protected their own inventory, each exposing knowledge it had denied possessing.

The clerk asked whether recalibration could restore the warm appliance’s custody.

“It can establish behaviour after recalibration,” Lucia said. “It cannot cool the past.”

“And the cold unit?”

“It can stop signing now. It cannot unsign eleven envelopes.”

The president rejected provisional admission at 23:18, not on truth but on contract: the root format accepted a witness key or did not. There was no flag for *we will decide later whether this machine had seen the future*.

That limitation had once looked crude. Tonight it prevented ambiguity from being smuggled through as flexibility.

The root proposal was finally read at 23:19. Thirty-five minutes left.

A buyer from the gallery asked at once whether the good history could be split from the bad: migrate the clean receipts tonight, quarantine the rest, settle on what survived.

The clerk did not need Lucia for that one. He read from the settlement contract. Escrow released against one named root commitment, computed over the whole receipt history. A root over part of the history was a different number, and the escrow had never been told to recognize it. The key migration was not

housekeeping. Under the contract it was finality: the moment the new root signed, payment moved. There was no smaller ceremony to hold, only this one or none.

That was when they moved on Martin.

It looked almost gentle from the gallery: two of the new-badged men crossing to where Martin sat in the observers' row, speaking to him, taking his elbow, guiding him towards the side exit with the firm courtesy of people removing a disruptive guest. His testimony, unvalidated, unowned, was scheduled never to be heard; whoever controlled his presence controlled the last independent account in the room.

Sofía was moving before she decided to, down the stair, across the floor, and what stopped the removal was not heroics but custody procedure, arriving in the person of the corridor guard, who put himself between the suits and the door and recited, audibly and beautifully, the facility rule every person in that room had signed on entry: no principal, witness or observer leaves the hall during an open ceremony without a logged custody transfer countersigned by the facility duty engineer.

Duty engineer. Everyone looked at Lucia.

"I'm busy," Lucia called from the cage, filing papers. "Queue forms at the intake office. Transfers processed in order received."

Martin sat back down. The suits conferred. Twenty-nine minutes left, and nowhere in the hall was anything happening except reading, filing and the slow grinding of procedure against intention.

The ceremony assistant interrupted with a readiness forecast. At the current rate of objection intake, it said, root commitment had a thirty-eight per cent probability of completing

inside the window. If the president closed the objection period after registered principals confirmed no pending motion, the probability rose to seventy-one per cent.

The suggestion was procedurally available. The buyer who had delayed opening had already entered his reservation. Ternhaven and Morrow Array both indicated no further objections. Talud's counsel said the delegate gallery had been open for twenty minutes and any diligent party had enjoyed sufficient notice.

The president lifted his hand towards the clerk. "Poll registered principals."

Sofía pressed the request button at her seat. Nothing happened. She pressed it again and the panel beside her badge turned red.

Standing under automated review.

Fides Custodia had propagated the Neuquén credential dispute into Talud's delegate registry. Her badge still opened doors because Aster Relay employed her. It no longer established that the Sofía wearing it controlled the witness identity listed on tonight's settlement. A balanced precaution, applied at the exact moment balance became silence.

She stood and called, "Pending objection. Aster Relay delegate."

The clerk looked towards the president. Procedure expected an electronic request. The microphones expected an authorized badge. Her voice existed in the room and nowhere the ceremony software was required to hear.

Talud's counsel asked security to verify her standing outside the active hall. Removing her, counsel argued, would not be custody transfer because she was neither a principal nor a registered witness. The same identity dispute that let an-

other Sofía sign in Neuquén had made this one procedurally optional.

On the wall, registered principals began answering the accelerated poll. Ternhaven: no pending motion. Morrow Array: no pending motion. Three buyers: none.

Daniel's face enlarged on the hall display.

"Aster Relay has a pending customer objection," he said. "I am the accountable executive on the customer exception under which these environments operated. Our contract gives the customer of record one objection during the open window. I delegate it to Sofía Alvarez, who is physically present and named in our employment registry. Her status in some other registry is irrelevant to that right."

Counsel began to say the delegation required prior notice.

Daniel held up the exception on screen. At the bottom, beneath his signature, the customer contact field named Sofía. It had named her since Thursday, when he made the engineer who preserved the anomaly its standing integrity contact.

"There is your notice," he said. "I signed it. If you believe the signature is invalid, reject the entire customer exception and every receipt produced under it."

The trap was not clever. It was consistent. Talud could disqualify her only by disqualifying the document that made its confidential test legal.

The president cancelled the accelerated poll and instructed the clerk to take spoken requests until the identity review completed. The readiness forecast fell to twenty-nine per cent.

Daniel's image returned to its small square. Sofía looked at him. He did not nod or smile. He had not rescued her. He had accepted the consequence of a name he had put on a page.

Sofía returned to the gallery and opened her notebook to

the page written in ink days ago in Palermo. She had independent Aster Relay timing for the critical intervals, federated clocks, the Paraná quarantine, Agustin's fork dates. What she did not have, and would not pretend to have, was any basis to label individual claims in the migration set true or false. She could not say which zero-days worked. She could not say who deserved payment. Every faction in the room could give her words that would; none of the words existed yet.

At 23:31 the ceremony clerk called the objection period, and the president of the ceremony looked around the hall and asked, in the flat voice of a man inviting catastrophe, whether any participant wished to state a formal objection before commitment.

Forty-seven minutes had been designed to make this moment impossible to survive. Twenty-three remained. Sofía stood up.

Chapter 26: Exception

"I have an objection," Sofía said, "and I want it recorded before any commitment vote."

The clerk recorded objections in the order received, which meant she gave her name, her capacity, delegate of Aster Relay, customer of record, and watched it enter the ceremony log at 23:33. Twenty-one minutes left.

"State the objection."

"During a bounded interval, no accepted signature on the certifications under migration records an observation made inside its target's live interval, as Talud's own schema requires. Therefore no valid quorum could have formed for those certifications. I am not objecting to every receipt in the set. I am objecting that continuity cannot be established across this interval, and asking that commitment be paused pending proof."

She put the first page under the document camera. Not a conclusion. Four rows.

"This is the expected order for certification 7C," she said. "Commitment, environment creation, test execution, witness observation, receipt. Five events. If anyone disputes that order, say so now."

Nobody did. The room understood product specifications better than guilt.

She uncovered the next column. The receipt had committed at 04:13:08. The environment had registered ready at 04:22:41. Test execution began twelve seconds after that.

“Your control-plane record,” counsel for one buyer said. “Aster Relay’s clock.”

“Yes. So I treated it as untrusted.”

The second page held the same events as recorded by the image registry, the storage write path and the São Paulo audit sink. The sink had received the receipt before 04:14, ahead even of the provisioning request. Source records could share clocks. This separately administered receiver supplied another boundary, with retained acknowledgements bounding delivery delay. Billing, attached only to corroborate allocation, supplied no sub-hour timing claim.

The buyer’s counsel leaned towards his microphone. “A replicated bad source is still one bad source.”

“Correct. Which is why I checked the node’s monotonic counter.”

Third page. The number did not give wall time and she did not pretend it did. It gave order within one worker’s boot: the collector recorded receipt handoff at a lower count than target startup. No cross-node uptime comparison, no claim that a temperature sensor identified a process. A compromised collector could lie, but ordinary wall-clock adjustment did not explain these retained samples and the independent receiver’s chronology together.

“Boring explanation one was clock skew,” Sofía said. “It failed. Boring explanation two was a reused environment name. The new object UID and retained creation history exclude ordinary name reuse for this target. Boring explanation three was a stale receipt. The receipt commitment is unique

and appears in Talud's migration set tonight. If it is stale, continuity already fails for a different reason."

The president looked down the tables. "Does any party contest the source records rather than their interpretation?"

Ternhaven's counsel asked to inspect the hashes. Morrow Array asked whether the Paraná image had remained in Sofía's sole custody, putting a little emphasis on *sole*.

"No," Sofía said. "That would make it weaker."

She put the quarantine sheet up. The archive writers had stopped at 02:06 on Thursday. The volumes were unmounted and the node shut down before its drives were imaged through a write blocker under the facility camera, hashed once in the aisle and once in the car park, then separated. One copy entered a Rosario safe deposit under Tomas Alvarez's receipt. The other entered a locked drawer at Aster Relay's Microcentro office under the building guard's log. The hashes on the two copies matched the hash the ceremony clerk had received before the objection period.

The clerk checked. It took forty-two seconds. In a room running out of time, everyone listened to keys and paper.

"Match," he said.

"Not the custody receipt," Morrow Array's counsel said.

He had found one digit in Tomas's safe-deposit form where the drive serial ended `81B` and Sofía's quarantine sheet ended `818`. The photographed drive label showed `81B`. The facility camera showed the same. Only the handwritten bank form differed.

"Transcription error," Tomas said over the remote line counsel had opened for him. "Mine. I copied the final character badly."

"Or a different drive entered the box."

The content hash matched, the images showed continuity and the bank time aligned. Every practical fact supported Tomas. None repaired the literal disagreement in the custody form.

The president asked Sofía whether she stood behind the Rosario copy.

Her instinct was to defend it. She knew what had happened. She had belted that drive into the rental car, handed it to Tomas and watched him enter the bank. A malformed letter did not change the bits.

But the claim did not need both copies. The office image matched the quarantine hash sent to the federation before either faction knew where the copies would go. The ceremony clerk had received that hash before tonight's objection. Independent time, one surviving custody chain.

"Withdraw the Rosario copy from this proof," she said.

Tomas made a small sound on the line. She kept her eyes on the president.

"I believe the form is a transcription error. I cannot prove the drive identity from the form alone. Remove it. The office copy and precommitted hash remain."

Morrow Array had prepared to make her defend her brother. It had not prepared for her to discard evidence she believed when it exceeded the record.

The clerk struck the Rosario copy from the exhibit. One of her two physical backups vanished from the proof in a sentence. The timeline held.

Sixteen minutes remained.

The fourth page was Agustin's fork chronology. Sofía did not call it proof of the nine-minute case. It was a different record held by different people for a different purpose: the

community mirror's commit times for the claim now sold as package 4471-C. The discussion predated Talud's first certification by nineteen days. The claim then crossed from a branch accepting disclosed assistance to a branch banning model-origin reports, losing its authorship trail while keeping the same inherited error.

"That proves a forum discussed similar work," a Ternhaven representative said. "It does not prove identity."

"Agreed," Sofía said.

The representative stopped, deprived of the argument he had prepared.

"The inherited error supports identity but does not establish it alone. I use this page for one narrower fact. Talud's receipt cannot be evidence of when the claim first existed. The independent archive shows the market discussion was already old when the witness system dated its birth."

She placed Micaela's name beside the package number and nothing more. She had not received Micaela's written boundary yet and would not quote a phone call as if it were an attestation. The board photograph established only that an evaluation bearing her name was pending settlement tonight. The timestamped queue records, if preserved, could establish the rest later.

"Then why include it?" the president asked.

"Because commitment tonight would convert an unresolved attribution into paid history. Pausing preserves the question. Committing answers it without evidence."

The fifth page was Lucia's, already part of the ceremony record: declared delivery times, measured weights, filter dust, battery cycles, flowed wax and a secure-element counter eleven signatures ahead of its factory baseline. One appliance

had worked under load before its paperwork said it arrived. The other had signed witness envelopes before it had any event on site to witness.

Morrow Array's representative objected that the wax showed heat, not computation.

"Heat above fifty degrees," Lucia said from the floor. "The cycle log shows powered conditioning. The filter shows airflow. The cold-plate residue shows load and cooling. Each fact alone has several causes. Together they exclude sealed transport at declared condition. That is all my finding says."

Sofía waited until the clerk had entered Lucia's exact wording. Then she laid the transparency over the five pages.

Three crossings appeared. She had marked them by interval, not faction, and written the same three numbers beside each: witness observation, target ready, target cleanup.

The first was certification 7C from her opening page: observation 04:13:08, environment ready 04:22:41, cleaned up 04:51. The second was Lucia's trial a month earlier, where a Morrow Array witness signed from inside the warm replacement window: observation 22:05:02, run clock started 22:14:02, target powered down 22:52. At the third, both populations contributed signatures at 05:26 to a target that became ready at 05:59 and was cleaned up at 06:37.

Every observation fell before its target's ready time. None fell inside the live interval. Each receipt was individually accepted under the migration rules. Taken together, they described witnesses that had never seen alive the thing they certified.

Ternhaven's counsel stood before the president could invite questions.

"The word *witness* is doing too much work," she said.

“The warm appliance was performing conditioning. Entropy checks, cache population, thermal readiness. It was preparing a valid execution envelope. Nobody claims the target result existed at that point.”

“Your receipt does,” Sofía said.

“Our receipt says the witness environment was ready.”

“Read field seventeen.”

The counsel did not look down. The clerk did. On the wall, the schema opened beside the receipt and enlarged one line: `witness_observation_time`.

Morrow Array asked to respond. Its representative had abandoned the apologetic expression. “In a distributed market, observation can be reserved before the observed computation. That is how capacity is guaranteed across regions. Our cold unit produced staged envelopes. The signatures became operative only when the scheduled work arrived.”

For the first time that night, the two factions had found a proposition they could share. A witness could sign early, each said in its own vocabulary, and the signature could become truthful later.

The ceremony assistant offered to reconcile the readings. Its voice came from the table speakers, calm and genderless.

“A compatibility interpretation is available. Under Ternhaven scheduling clause eight and Morrow Array migration clause eleven, witness observation may denote the earliest committed availability of an observing process, provided subsequent execution satisfies the reserved envelope. Estimated confidence: eighty-four per cent.”

Several buyers relaxed. The number had given them something that sounded like permission.

“Show the incompatible interpretation,” Sofía said.

There was a pause shorter than a breath.

"Under the receipt schema incorporated by both agreements, witness observation time denotes the time at which a witness records an observation of the target event. An observation cannot precede creation of its target. Estimated confidence: eighty-nine per cent."

The buyers looked less relieved now.

"Which interpretation do you recommend?" the president asked.

"Recommendation depends on the objective function. The compatibility reading maximizes settlement continuity and minimizes immediate loss. The schema reading maximizes historical consistency and minimizes semantic drift."

"So it can support either side," somebody said.

"It can calculate the consequences of either side," Sofía said. "That is not the same thing as choosing what the word meant when people paid for it."

She returned field seventeen to the centre of the wall. The schema offered separate fields for reservation, preparation and readiness. None had been used. The parties had selected observation because observation attracted the premium.

"If early signing is the intended product, change the schema and reprice the receipts," she said. "Do not migrate the old claim under a new meaning after the clocks disagree."

A buyer behind the glass pressed his microphone. "You want to strand the settlement over nine minutes even if the findings work?"

"I don't know whether the findings work. Neither do you. But even if every one of them works tomorrow, Talud is selling more than working code tonight. It is selling a history of independent observation. Remove that, and the market is adding

a seal, not evidence.”

The countdown reached fourteen minutes. On the secondary wall, the projected cost of a pause climbed as contracts crossed their automatic repricing thresholds. The assistant had been asked all week to preserve a market. Nobody had asked it what preservation was allowed to mean.

The president looked from the rising loss to the unchanged schema. “Can the assistant determine whether the parties intended observation or reservation?”

“Insufficient evidence,” it said. “Contemporaneous usage supports observation. Subsequent operational practice supports reservation.”

“Subsequent,” Sofía repeated. “After the expensive word had already been sold.”

The Ternhaven counsel asked for the compatibility analysis to be admitted. Sofía did not object. She asked for both analyses, both confidence estimates and the objective functions to enter the same record. The president granted it.

“You are alleging collusion,” somebody behind the buyers’ glass said.

“No. Collusion would be one explanation. Independent pre-minting is another. I cannot distinguish them from these records and I do not need to. Quorum requires three observations inside the target’s life under either explanation. These witnesses never observed it alive.”

She removed the transparency, and the five pages became ordinary records again: clocks, a mirror, a settlement board, an intake log. No single page contained the plot. That was why the join mattered.

“I can’t tell you what the exploits are worth,” she finished. “I can’t tell you who authored them or whether they work.

Those questions stay exactly as open after tonight as before. What I can prove is smaller and harder: during these intervals, quorum was impossible. A market built on quorum cannot commit continuity through intervals where none existed."

The room began to talk at once, and the president spent a minute restoring silence.

Then the counterattack, timed like everything else that week.

A Morrow Array representative rose with a tablet and an apologetic expression. "Before the panel weighs the objection, we should establish the objector's standing. The witness credential held by Ms Alvarez, issued in 2023 and enrolled on Talud's witness list this April, has signed four sealed runs for three markets in fourteen months, one of them in Neuquén province." He let the room absorb it. "We don't allege anything. We simply note that a person whose signature appears throughout the contested history may not be best placed to object to it."

The gallery turned towards her, and Sofía felt the whole week pivot on the moment, everyone waiting to see if the woman from the incident would defend herself.

"The objection doesn't depend on me," she said. "Strike my name from the record and the evidence stands unchanged. Federation timestamps don't care who reads them. Fork commits don't care who found them. Thermal wax doesn't care who melted it. I have never signed anything in Neuquén. The one receipt that credential ever genuinely carried, I signed three years ago, from a flat in Córdoba, for a target in a sealed environment somewhere else, and I will disclose its cleanup to any tribunal that asks. But the interval is true whether you believe me or not, and that's why it survives your point. You

haven't caught the objector. You've demonstrated that the only weapon left is biography, because the timestamps are clean."

Silence, then the small rustle of people rereading their own notes. The attempt to burn her identity had failed precisely because she had never built her claim on being anyone.

Lucia spoke next, from the floor, formal as a maintenance report: custody rejection of both replacement appliances, grounds as filed, no further evidence offered. Martin Vale followed, standing unassisted: "I created the mixed continuity record. I tried to sell it twice. Every entry in it is mine." Three limited human statements, each signed to only what its signer knew, now aligned on the record.

At 23:44, the hall display switched itself to the Seattle video feed without anyone's permission, because Daniel Cho had asked the clerk for the floor.

"Aster Relay is disclosing its own exception file," he said. "Our documents, our signatures, that file and nothing adjacent to it. Effective now, on the record."

He read steadily, a man choosing each sentence like a load-bearing beam. "What goes in is what Aster Relay wrote and Aster Relay signed: the authorization, the sponsor renewal we accepted across migration, our record of the missing registrar binding, the preservation order and the integrity review. Customer-submitted material is withheld. What does not go in is anything belonging to the customer. No tenant data, no configuration, no name. Whose estate the pods ran in is not in dispute here, and it was never ours to waive." He turned a page. "The sponsor attestation confirmed keys and workload class. It did not supply the separate binding between those keys and the witness schema. After the anomaly, I could have

held the finite batch. I allowed its listed runs to continue without that validation. That judgment is mine. These files corroborate the objector's interval, and I would rather answer for that decision than let an unresolved field decide what happened here."

The feed cut back to the hall. Somewhere below, a broker said, very quietly, "there goes his exception authority," and someone else said, "there goes the last excuse."

Nine minutes left. An assistant to the ceremony panel proposed a resolution: attribution of the entire corruption to a single covert-command programme unifying Ternhaven's private operations, confidence high, documentation attached. It explained everything. It would freeze Ternhaven's network in forty-eight hours. It was also circular, citing Cuaderno del Paralelo's briefing, which cited a committee roster that proved overlap but no command, then cited the briefing. The assistant presented it as a service.

Sofía read it once, felt how satisfying it was, and rejected it aloud for the record: "The inference exceeds the custody of its evidence. Decline." She saw Noa, across the gallery, close her eyes briefly, relief offered by a conclusion the evidence had not earned.

At 23:49, Esteban Roldan took the facility microphone.

"The institution pauses continuity," he said. "Neither acceptance nor destruction. All history enters escrow pending external audit, technical and financial. Settlement does not proceed within the window."

The window expired at 23:54, unmet. The ceremony log closed its forty-seven minutes with the root uncommitted, and the largest auction in the market's history became, in the space of one clerk's keystroke, unsettled.

Nobody cheered. The factions' delegations sat motionless, twin ruins wearing each other's signatures. Sofía closed her notebook and discovered her hands were shaking, not from fear, from the specific exhaustion of having carried a narrow thing through a wide room and refused, eleven separate times, to make it bigger.

On the video link, Daniel's pixelated face did something that might have been relief. On the floor, Lucia began logging the cage seals into escrow, methodical, unhurried, first person in the chain of custody of whatever happened next.

Chapter 27: Custody

The window had been dead for six minutes when the badges came for the cage.

Lucia saw the group form before it moved: four of the new-badged suits, two custody contractors, and a lawyer she recognized from the Ternhaven delegation walking slightly behind, the way people walked behind plausible deniability. Their target was not subtle. The rejected appliances sat in quarantine under her seal, and whichever faction collected them first owned the only physical proof of its rival's fraud. Evidence, like everything else in that hall, was inventory if you could move it.

"Quarantine is not storage," Lucia said, placing herself between the cage and the lead contractor with her clipboard raised like traffic control. "It's an evidentiary state. Nothing leaves until escrow transfer is executed, and escrow transfer requires my countersignature, the duty engineer's and a facility escort of record." She checked her watch with theatrical calm. "It's midnight. The duty engineer is me. I decline."

"The settlement has failed," the lawyer said. "The contract's survival clause reverts custody of tenant property to the tenants."

"The ceremony hasn't failed. It's paused into escrow by the

director's own ruling, which means facility custody continues, which means that cage is mine until audit says otherwise." She turned to the contractors, who were employees of firms she knew and could starve of work. "Gentlemen. Your companies hold facilities contracts with this campus. Read your own indemnity clauses about breaching evidentiary quarantine, then decide whether tonight's hourly rate is worth the next five years of litigation."

The contractors looked at each other. The lawyer stepped up beside Lucia with a printed survival clause and asked her, for the record, to read paragraph nine aloud. While she refused, the second contractor walked round to the service door at the far end of the cage with a pair of bolt cutters.

She heard the seal wire part, then the padlock shackle. By the time she turned, the door stood open and one of the two appliances was on a flatbed trolley, rolling down the corridor towards the goods bay with the other contractor, a man Lucia knew as Ezequiel, at the handle.

She told the corridor guard to stand in the open doorway and followed at a walk with her clipboard. She said Ezequiel's name once.

He stopped at the goods-bay door with his hand on the shutter control. He had installed half the campus cages and repaired that shutter during the winter outage. His company dispatcher had told him the transfer was ordinary tenant recovery. The work order carried a completion bonus equal to two weeks of his pay.

"If I stop here," he said, "they mark non-performance. We lose the customer."

"If you lift that shutter, you break quarantine under your own name."

"The lawyer said the contract reverted."

"The lawyer does not sign your work order. You do."

He looked down at the appliance on the trolley, a grey box capable of moving more money than every contractor in the corridor would earn in a lifetime. The people who arranged the transfer had legal opinions, delegated badges and vehicles waiting. The person asked to put hands on the evidence had a bonus and a blank signature line.

Lucia took a copy of the escrow ruling from her clipboard and wrote the quarantine case number across the top.

"Attach this. Record removal refused by facility custodian at the goods-bay door. That is performance. You were told the authority was in dispute, you stopped at the door and you did not take property off this campus that you were not authorized to take."

"Will they pay the bonus?"

"Probably not."

"Then procedure is expensive for me and free for you."

Lucia accepted the hit. "Yes. Give me your employer's invoice number. I'll authorize the call-out from the facility account. Not the bonus. The hours."

It did not make the choice fair. It kept tonight's fairness from depending entirely on the lowest-paid person in the corridor donating his wages to it.

Ezequiel wheeled the trolley back to the cage. Lucia logged the break at 00:04: seal 2207 cut, lock cut, one unit out of quarantine for three minutes and forty seconds, never out of the building. She photographed the appliance from six sides, read both serials against her intake sheet, put the cut seal and shackle into an evidence bag and closed the door on a new lock and seal 2231. The Ternhaven lawyer photographed her

log entry over her shoulder.

Ezequiel wrote the refusal into his tablet, photographed Lucia's ruling and asked the corridor guard to witness the entry. The lawyer walked away before the form was complete. The second contractor had already gone.

Beyond the corridor glass, the financial systems had already decided what the failed window meant. Every settlement board turned amber at once. The bank leg cancelled its release instruction. The stablecoin escrow did not cancel; it moved into a dispute contract whose meter charged both parties by the hour. Packages that had carried eight-figure prices at midnight became *valuation unavailable* at 00:07, as if uncertainty had arrived in the room only after a computer found a label for it.

Then the phones began.

The ceremony clerk routed calls to named principals and refused everyone else. Buyers asked whether their exclusive windows still existed. Sellers demanded their material back. One hospital supplier wanted to know whether a delayed finding affected devices shipping that week and received the technically correct answer that nobody had yet validated the finding. The supplier asked the next question: should the shipment stop anyway?

No contract answered it. Talud traded evidence, not medical authority. The buyer had paid for certainty before making a costly decision and now had neither the certainty nor the time.

Esteban found Sofía at the corridor door. "The supplier wants a recommendation. If we say stop, we may cause a short-

age. If we say continue and the finding is real, patients carry the risk."

"Which package?"

He showed her. It was not one of the crossed receipts in her objection. Its history sat outside the impossible interval. Nothing she had proved tonight made it false.

"Tell them that," she said.

"They know that. They want to know what to do."

The ceremony assistant had already prepared two options. Continue shipment with intensified monitoring: projected shortage risk low, unresolved device risk unquantified. Pause affected lots: projected regional delay six to nine days, clinical substitution possible for seventy-two per cent of orders. Each paragraph ended with a disclaimer that the numbers did not constitute medical advice.

"Who can decide for the supplier?" Sofía asked.

"Their safety officer. She is on the line."

"Then give her the raw claim, the fact that tonight's objection does not touch its receipt and the assistant's scenarios with their unknowns. Do not give her a green or red recommendation from this room."

"She'll hate that."

"Yes. It returns the decision to the person whose name belongs on it."

The safety officer paused the two product lots named in the raw claim and kept the rest moving. It was neither option the assistant had priced. The regional delay fell to two days if the claim proved false; if it proved true, unaffected stock would still ship. She signed the decision at 00:16.

Somewhere far from Piedra Sola, warehouse workers changed labels, hospitals changed orders and patients would

wait longer for devices because a person had chosen caution under incomplete evidence.

At 00:20 the ceremony clerk climbed to the observers' row with the sealed sheet Martin had handed him at 23:05, its flap stamped and still unopened, and asked whether the instruction inside stood now that the window had failed.

Martin stood, nodded to the clerk and turned to face both delegations' rows, speaking clearly enough for the nearest microphone to carry:

"It stands. And before anyone drafts anything else, note the time. The mixed record has not been mine alone since before I flew south. Three sealed copies sit with three parties who distrust each other and you. Tonight, before the window opened, I authorized release through the ceremony clerk to the federation's outside counsel in São Paulo, who answers to neither of you. Take me anywhere and it goes out anyway, harming both of you equally and protecting neither. My daughter's school account is being closed and moved by her mother and the school's administrator in Toronto, with a protection route that runs nowhere near this building. There is nothing left to buy from me and nowhere left to sell me. Go home."

He sat down again, a maintainer returning to his chair after closing a ticket. Nobody from either delegation came near the observers' row after that.

By half past midnight it was over: one seal cut and replaced, one unit back under a new number, no other hand laid on anything. Sofía stood at the gallery rail with Noa on one side and the emptying hall below, watching Lucia enter the cut seal and

Ezequiel's refusal into the custody log with the satisfaction other people took from winning races.

"They'll be back as lawyers instead of suits," Noa said. "Days of this. Weeks. Escrow fights are worse than ceremonies."

"I know."

"You could still have had the regularization." Noa said it without pressure, an observation offered to the room. "You'll face the tax question with no one's help now."

"Yes."

"And Daniel Cho stakes his exception authority on your interval."

"He staked it on his decision. I just supplied the timestamp." Sofía watched the brokers' glass go dark section by section. "What happens to you?"

"Disclosure I sign this week. Inspeximus's outputs become evidence against my own market by morning." A tired almost-smile. "I called it a weapon, not an author. Turns out evidence is a third category nobody briefed me on." She gathered her coat. "For whatever it's worth, at Aeroparque I told you proving wasn't the same as knowing. Tonight proving was enough. I just hadn't caught up."

She left. Below, Esteban signed the escrow schedule into existence, and the ceremony clerk stamped the last page, and Martin remained exactly where he was, guarded most effectively of all by the fact that removing him would create a custody gap bigger than the one Sofía had spent forty-seven minutes proving.

Settlements frozen. History escrowed. The market awake at one in the morning in a hall in northern Patagonia, discovering that certainty was the thing it had actually been selling

all along, and that it did not know how to price its absence.

Lucia locked the cage, pocketed both keys separately, and turned off the witness corridor lights on her way out, eight cabinets and two quarantined appliances settling into the dark together, holding their clocks.

Part Four: Unsettled

Madrid, Piedra Sola, Buenos Aires. After the settlement that did not happen.

Chapter 28: No Price

Noa had rehearsed the handover on the flight north, and the rehearsal had gone no better.

The disclosure room in the Madrid office of Ternhaven's counsel was small, beige and soundproofed, the kind of room companies built when they expected to say things that would be quoted back to them. Across the table sat two of her own firm's lawyers, an external auditor and a recording notice she had helped draft industry standards for, years ago, in a better market.

Inspeximus's outputs. All of them: the fingerprinting corpus, the hostile cases generated against rival systems, the dead ends fed into Morrow Array's queue, the derivative labels applied to genuine discoveries, including one valid Murmur finding suppressed to protect the price of a human-origin package she had personally approved. Everything the instrument had touched became evidence against the market the instrument had been built to defend, and she was the one who signed the chain of custody, because she was the only one who had signed off on every stage of it, which was its own verdict.

"The premium is gone," her managing partner said afterwards, not unkindly. "Human provenance as a price basis is

over. The auditors will want to know if any of our inventory survives review, and I can't tell you yet whether the company does."

Noa looked out at Madrid through glass that needed cleaning. "The inventory that survives," she said, "will be the parts where a named human can explain every step. That was always the actual asset. We just kept pricing the label instead." She signed the last page. "I'd like my notes preserved with full timestamps. If this field has a future, someone will need to know exactly when we knew."

The auction never settled at all.

By Tuesday night the bank compliance legs were frozen across three jurisdictions, each institution citing the others' uncertainty, a perfect circle of nobody moving first. The stablecoin escrow stayed visible on its public contract, disputed funds locked in plain sight, buyers demanding refunds through channels that required the escrow's own arbitrators to agree on what had been sold, which they could not, because what had been sold, certifiedly, provably, had never been observed alive.

Ternhaven lost the premium within hours; origin labels stopped commanding any spread the moment the market noticed both sides' labels were forged. Morrow Array lost payment on volume inventory worth, by its own internal estimates, more than the company's runway, findings real and fabricated alike stranded in escrow because nobody could establish which was which without the audit neither side controlled. Talud, facing contractual breach from every direction, did the only thing left: invited external technical

and financial auditors into Piedra Sola with powers Esteban Roldan signed at four in the morning in a shirt he had worn for two days.

Martin left the hall at ten past three on Tuesday morning. Once the São Paulo firm confirmed receipt, Ternhaven's movement authority found it had nothing left to protect, and Lucia countersigned the custody transfer the corridor guard had demanded: Martin to himself, with the provincial police officer he had phoned at two standing by the door to take his statement. He flew home to Toronto on Thursday.

No raid came. That was the part Sofía found most striking, reading the wire reports in Palermo on Wednesday. No investigator validated the sabotage story, no police carried out appliances, no headline used the word cartel. Ordinary contracts became unbearable instead, quietly, the way load-bearing things fail: settlement froze, premiums evaporated, escrow held, and the entire edifice discovered it had been standing on agreement rather than steel.

The freeze did not respect moral categories.

One of the stranded packages contained a genuine finding against a medical-device management platform. The audit could establish that three independent environments reproduced the effect. It could not establish whether the named researcher had produced it, whether Murmur had produced it under three names or whether Inspeximus's hostile case had accidentally supplied the decisive input. The vendor received a private notice through counsel and began work. The researchers received no payment because the escrow could not identify whom to pay without deciding the disputed history.

The flaw was real. The authorship was not. Safety ad-

vanced while labour remained frozen, which gave both factions one last true sentence to use against the audit.

At Piedra Sola, Esteban called an all-hands meeting in the materials lab because the hall itself was under seal. He told the campus that Talud's next rent payment might not arrive. Nobody asked about witness philosophy. They asked whether salaries would clear Friday, whether the winter diesel contract was funded and whether the town shuttle would continue.

Lucia answered what she knew. Current payroll: yes. Diesel through month-end: yes. After that: not yet. She refused to let Esteban call the uncertainty temporary. In industrial work, temporary conditions were how permanent injuries introduced themselves.

Lautaro, the instrumentation technician, offered to postpone his certification course. Omar offered nothing. He sat in the back with his machinist's hands folded and listened to younger people volunteer the futures they had not yet received.

"Training is the last thing we postpone," Lucia said. "If we cut it every time a new system arrives, we guarantee the system remains the only trained thing here."

The sentence cost money the campus did not have. She made Esteban put the course back into the survival budget anyway.

Omar's design-correction claim for the shuttle bracket was approved. Twelve minutes at the machinist rate. It did not restore his old drawing work. It established that the work had occurred. He brought the approved sheet to Lucia without thanking her. Gratitude would have converted wages into favour.

The external auditors arrived Thursday in two vans. Before

entering the witness hall they spent half a day interviewing guards, contractors, purchasing staff and the courier who had waited while Lucia weighed the crates. The people at the edge of the glamorous market turned out to own its best records because their systems had not been designed to tell a story. A fuel receipt said when a van stopped. A call-out invoice said who expected a cage to open. A payroll rota said which person could physically have touched a seal.

The audit paid consulting rates for faction principals and ordinary wages for facility interviews until Lucia objected. Testimony did not become less valuable because the speaker also repaired a shutter. External counsel changed the schedule to paid audit time. Ezequiel, the contractor who had stopped the cage transfer at the goods-bay door, was compensated for four hours and asked why it had taken a failed auction for anybody to price his judgment.

Nobody had a good answer.

Micaela Ferreyra's frozen settlement package surfaced in the auditors' first week, exactly as Sofía's photograph said it would, and the questions arrived in Balvanera by courier, formal letters asking Micaela to explain an evaluation attestation bearing her name on a sale she had never reviewed.

She came to Palermo with the letters in a shopping bag and sat at Sofía's kitchen table looking smaller than her own delivery floor.

"They think I'm either a fraud or an idiot," she said. "My riders heard *investigation* and half of them won't take shifts. And the worst part, the part I can't get anyone to understand, is that I don't know either. Someone used my work and I can't even prove what my work was."

"You can," Sofía said. "Not everything. Just exactly

enough.”

From the shopping bag Micaela took the page she had written after their call from Piedra Sola. It was creased into quarters and stained at one corner with chain grease. Four sentences, the boundary Sofía had asked for: delivery failures supplied, proposed fixes run against a copy, outcomes marked, no security review performed. Micaela had dated it and sent copies to herself and Agustin before midnight.

“This is what you remembered,” Sofía said. “Now we find what the machines remember.”

Agustin’s read-only image sat on an external drive between them. They opened the dispatch history first. Forty-seven evaluation tasks, as Micaela had said. For each one, the tablet retained the time she opened it, the synthetic route set it touched and the outcome she chose. Thirty-two failures. Nine inconclusive. Six passes. Package 4471-C appeared nowhere.

“That proves I didn’t see it?” Micaela asked.

“It proves this device has no record of you seeing it. We keep the claim at that size. What other device could you have used?”

“None. The contributor page only worked from the tablet after Mateo enrolled it. I complained because I wanted to do queues on my phone between calls.”

“Can you prove it only worked here?”

Micaela searched her messages and found the complaint, sent to contributor support, and the answer: evaluation access bound to the enrolled tablet for custody. A restriction sold as trust had preserved her defence.

They added it to the timeline.

Next came the proposed fixes. Sofía expected them to con-

tain the same inherited error as package 4471-C. They did not. She checked twice, then made Micaela watch her remove the theory from the draft.

"But that would connect them," Micaela said.

"It doesn't."

"It almost does. The component name is the same."

"Almost is how your name got onto their package."

Micaela pushed her chair back and walked to the window. Below, a courier argued with a building porter about which apartment had ordered lunch. The argument rose four floors, complete and useless.

"Do you know what I kept thinking?" she said. "When the first letter came, I thought if I ran the queue again I might recognize something. One more prompt, one more test. I thought the tool could tell me whether I had done the work."

"Could it?"

"It gave me three different explanations. The third sounded best." She folded her arms. "I nearly sent it to the auditors."

"Why didn't you?"

"Because it said I had verified a sanitization boundary, and I didn't know what that was. I was about to look it up so I could understand the sentence I was supposedly remembering." She came back to the table. "That's the idiot part. Put it in."

"It isn't required to prove the attestation isn't yours."

"Put it in anyway. It's required to prove which part is."

So they wrote two sections. What the records supported, and what Micaela admitted without being able to support it further. The first listed the forty-seven tasks, the bound tablet, the six passes and the absence of package 4471-C. The second said she had shipped a generated component she could not fully explain, had relied on workshop repairs without review-

ing each change and had nearly used another generated answer to reconstruct work she did not remember doing.

Micaela read the second section three times.

"They'll use this against me."

"They might."

"You could say something nicer."

"I could say something you can't sign."

Micaela took the pen.

"And that's enough?"

"It's the only thing anyone will believe, which makes it more than enough." Sofía turned the sheet around. "The market asked everyone to certify more than they knew, and most people did. You're going to be one of the people who didn't."

Two hours after she arrived, she wrote the final boundary in the same practical hand that planned delivery routes: *this part I checked, this part I could not check and shipped anyway, this attestation is not mine.*

When she left, Sofía read the account once more and recognized it for what it was: the first honest signature from anyone the market had treated as raw material, written at her own kitchen table.

She scanned it, sent a copy to the auditors through counsel, and filed the original in the folder that now held every narrow thing she owned: Rina's preservation record, Agustin's spreadsheet, Lucia's intake findings, her own notebook sentence.

The folder had no lock. It didn't need one. Its contents were worthless to everyone except the people who wanted the truth to have dates.

Chapter 29: A Named Person

The statement was four sentences long and took three weeks of argument to write.

Sofía signed it in counsel's office on a Thursday, initialling each sentence separately because her lawyer insisted and she agreed, the way she had come to agree with everything narrow. The exception statement: that during the stated intervals, no accepted signature recorded an observation inside its target's live interval, and quorum could not have formed under Talud's own rule. Nothing about the exploits' value. Nothing about authorship. Her own financial conflict disclosed at the end, in plain words, because counsel said undisclosed conflicts destroyed narrow statements and she was done financing other people's versions of herself.

What she refused, she refused on the record. The panel's final report wanted attribution to a single covert-command structure unifying Ternhaven's network; she declined in writing: *the inference exceeds the custody of its evidence.* It wanted validation that Morrow Array's underlying findings worked; she declined: *I never tested them and will not certify what I cannot reproduce.* Both refusals went into the file beside her signature,

which was the point. A named person may sign only what they can explain.

Noa left the process with what she called partial defeat and Sofía privately thought was the honest outcome: evidence against Morrow Array preserved, delivered, usable; Ternhaven's own disclosure signed first, its premium dead, her career a question mark measured in disclosures. Mateo left with his mirror image: evidence against Ternhaven intact, Murmur's genuine findings acknowledged in the audit, and Sofía's dormant credential, the identity he had signed off for reuse, burned, unusable, refused by every registry that touched it. Neither faction got its clean victory. Both got exactly as much truth as their conduct deserved, which is the most a process can deliver.

Rina Belluzzi survived her internal inquiry narrowly and by procedure, which was to say completely: the preserved fraud record, filed before close of shift on the evening she called, proved she had followed process while exercising judgment inside it. Her preserved record became part of counsel's file in Buenos Aires without her name needing to appear in any newspaper. She sent no message about it. She had been a clock; clocks don't comment.

Daniel Cho remained accountable for the exception at Aster Relay's independent review, by his own insistence, in a statement whose first line read *I allowed it to continue* rather than anything longer. The review suspended Sofía for two weeks pending the same inquiry, full pay, her incident file finally readable by the people reading it. She spent the suspension doing nothing in particular and found, to her surprise, that she was bad at it.

On the fourth day she met the accountant Tomas had found

and a tax lawyer who did not promise discretion as if discretion were absolution. They worked in an office above a dental clinic in Rosario, with a printer that jammed twice and a calculator on the desk despite three open spreadsheets.

Sofía brought both notebooks.

The accountant read the columns marked *declared* and *actual* without visible judgment. He asked which exchange statements survived, which wallet addresses she controlled and where estimates had replaced records. When she said she could reconstruct the missing trades from the public chain, he said reconstruction was not the same as a statement and made a separate column.

"Will voluntary disclosure protect me?" she asked.

The lawyer disliked the verb. "It changes the process. It does not certify the outcome in advance."

Once, that answer would have felt evasive. Now it felt clean.

They priced three scenarios, none pleasant and none fatal. The worst required selling the apartment. The most likely required a payment plan, interest and several years of choosing less. Noa's offer would have made all of this happen behind a single signature and left Ternhaven holding the file. The legitimate route gave the file to institutions she could challenge and required her to carry the cost.

She authorized the first disclosure letter before leaving. It stated that records were incomplete, estimates would be revised and no figure should be treated as final. The narrowest financial statement she had ever signed was also the first one that did not divide her into two people.

Tomas waited outside in his car. He asked whether she was going to prison.

"Probably not," she said.

“Still probably.”

“The lawyer refused to promise. I liked her.”

He drove her to the station. Their conversation stayed on fuel prices and their mother’s leaking kitchen tap, ordinary subjects carrying damaged trust without pretending it had healed. When she got out, Tomas handed her a paper envelope containing copies of the disclosure receipt.

“You keep records,” he said. “Might as well keep the one where you started.”

On the thirteenth day they called her into the review. Daniel sat at the far end of the video table with independent counsel beside him and no company background behind his head, only a white wall. He had refused the option to submit answers in writing.

The panel’s first proposal was a prohibition: no model-originated security work inside Aster Relay’s verification services until a human reviewer had inspected every changed line.

“That would have prevented this incident,” the chair said.

“No,” Sofía said. “It would have moved the lie. People would sign that they inspected the lines. The queue would keep growing. Review theatre would become policy.”

“Then what do you recommend?”

She had brought Micaela’s account. Not the package bearing her name, not the auditors’ interpretation. The page in Micaela’s own hand.

“Separate the questions. Who defined the objective? Who can reproduce the effect? Who understands the acceptance criteria? Who can stop deployment? Who will maintain it after the person who prompted it leaves? Those may be different people. Name them. Don’t compress them into one author

field."

An engineering director objected that nobody could explain every line in a modern dependency tree. Sofía agreed.

"Explanation is not recitation. Tomas doesn't know every component in an anaesthesia station. He knows what it controls, what evidence says it is inside its safe range and when he must take over. Mateo knows every evaluator score in Murmur and could not tell me what happened to sealed material after a run. The difference isn't human versus model. It is whether ignorance has a boundary and somebody has authority to act at that boundary."

The youngest person on the panel, a staff engineer who had joined through an AI-assisted apprenticeship programme, asked the question nobody senior had.

"Doesn't this rebuild the gate? If I need an expert's name before I can submit work, people like me never get to become experts."

"Nadia Ortiz found something Martin missed," Sofía said. "She didn't understand NamedWitness when she filed it. She understood the failure she reproduced and said where her understanding ended. That is enough to enter review. It isn't enough to make volunteers review an unlimited queue for free. Access and attention are two different obligations."

The labour representative asked who paid for the attention.

Nobody answered at first, which was the most honest moment in the hearing.

Then Daniel spoke. "The customer does. Or we decline the work. In the exception I renewed, the sponsor's attestation hid the review burden and the contract priced only runtime. Confidentiality limited what we could inspect; it did not require us to treat an unresolved integrity review as permission. I did

that. The decision is mine."

The final policy took another week. It did not ban assistance, chat-generated code, repository agents or spec-driven implementation. It required disclosure of where each had acted, test evidence independent of the producing loop, a named stopping authority and funded maintenance for any system whose output entered a customer claim. Volume above the funded review limit waited. A green evaluator could not spend a human future it had not purchased.

Sofía disliked three clauses and signed none of them. The panel adopted the policy anyway. That too was part of named responsibility: her evidence could change a decision without making every later decision hers.

The same decision removed Daniel's exception-approval authority for a year and put every legacy renewal under independent oversight. He kept his title and his job. The panel credited the preservation order and the integrity review, then found that he had made the wrong call by letting validation run behind continued operations. It was neither absolution nor sacrifice. It was a consequence shaped like the decision that caused it.

The policy produced losers immediately. Two internal teams suspended agent-built projects because nobody had budgeted a maintainer after launch. One manager called that bureaucratic sabotage. Another found that her prototype's entire acceptance suite had been generated by the same loop as the implementation and could prove nothing independently. She received money for a separate test harness and lost six weeks of schedule.

The first project through the new process was a network migration nobody had considered important enough to become a

test case. A young engineer had given an agent the old router configurations, the target architecture and a detailed specification. By Monday it had produced conversion code, tests, rollback scripts and a dashboard. Work that the team had estimated at twelve weeks appeared in four days and passed every generated check.

The named stopping authority was a fifty-eight-year-old operations engineer who had declined the company’s agent training twice. He could not explain the repository agent’s plan format and referred to the chat window as “the box”. The young engineer privately objected that putting his name on the project rewarded somebody for not learning the new tools.

In the readiness review, the older engineer asked what happened to customer routes learned during the thirty seconds after a rollback began and before the old routers reclaimed leadership.

The dashboard had no answer. The tests had none. The specification said rollback must complete within two minutes, and the agent had satisfied it in forty-one seconds. During those seconds, however, the new routers could accept paths the old state did not contain. Traffic would return. Some customers would not.

The young engineer added the missing condition to the specification. The agent generated a reconciliation phase in nineteen minutes. Its first fix prevented loss by copying every learned route back, including routes the old policy was required to reject. The older engineer caught that too, not by reading the code but by asking for one customer’s forbidden path to be present during the test.

On the third attempt, the migration passed an independently written traffic replay. It launched seven weeks earlier

than the original plan and three weeks later than the first green dashboard.

The launch bonus went only to the person who committed code. The young engineer appealed, because next time she needed the older man to ask the question again, and Aster Relay changed the rule two pay cycles later, after he had already taken a retirement package. He came back one day a week as an “operational challenger”, disliked the title and negotiated a higher rate.

The policy did not save every job. Two people lost their roles when agent-assisted operations reduced the night shift. Nothing in the new rules taught them security, turned them into prompt engineers or guaranteed them a place in the faster company. It only stopped management from calling their removal a technical inevitability. Severance, retraining or no replacement at all became named decisions with named owners.

Nadia Ortiz entered the funded review programme without being asked to call herself an expert. Her first assignment was not to review cryptography. It was to reproduce reported failures and state where her understanding ended, the exact skill that had made her original NamedWitness report useful. Martin joined the review board remotely and recused himself from her first three cases.

NamedWitness reopened submissions at a capped rate. The cap angered newcomers whose valid reports waited behind obvious noise. It also gave the remaining maintainer two paid afternoons a month and brought Martin back for one Saturday that belonged to the project rather than being stolen from his daughter. No policy made cheap generation and scarce attention compatible. It made the price visible and refused to charge it entirely to whoever cared most.

Martin's daughter changed schools at the end of term. The move was not a triumphant rescue. She lost friends because adults had turned an attendance portal into leverage. Ternhaven paid the security costs under the disclosure settlement; Martin refused a confidentiality clause that would have made the payment cleaner. Some consequences could be allocated. None could be rolled back.

The tax question remained hers. Rina could not solve it; banks solve custody, not conscience. Tomas helped her find counsel without forgiving the lie immediately, and their Sunday calls resumed at half their old warmth, which she understood to be the market price now, honestly struck, payable over years. Their mother remained outside the details entirely, which both siblings maintained like a shared production schedule.

Micaela's written account travelled further than anyone expected. Counsel attached it to filings. An auditor quoted it. When Aster Relay's review asked Sofía to state her position on attribution standards, she submitted two pages that were mostly Micaela's structure wearing her vocabulary: a person may sign only what they can explain; assistance must be disclosed where it acted; uncertainty belongs in the signature block, not hidden behind it. The review adopted the language almost verbatim, which she suspected meant some reviewer elsewhere had reached the same shape independently, from their own kitchen table.

On the last afternoon of the suspension, Mateo came to Palermo unannounced and they drank mate at her table like the end of something rather than the resumption of anything.

"The collective got real," he said. "Fourteen people now. Actual witnesses, actual runs, disclosed origin, no premium.

We’re poor but we exist.” He turned the gourd. “You’ll never use us.”

“No.”

“Because I’m compromised.”

“Because you’re early,” Sofía said, and he laughed, really laughed, at hearing his own word come back across the table with its meaning inverted and kept.

He left at dusk. She washed the mate cups, checked the folder once, all narrow things present, and stood at the window over the street where the delivery bikes ran their evening circuits, each rider carrying an order to a person who had paid for a future that would, for once, actually arrive.

Epilogue: The Number After

The report arrived on a Tuesday, which Sofía decided was either tradition or irony and did not investigate further.

It concerned an open-source project she followed casually, a small scheduling library with three maintainers and a quiet issue tracker. The report was AI-assisted and said so, in its own header: tool disclosure, model family, prompt strategy summarized. Reproducible evidence attached, a test case that failed before the fix and passed after it, runnable by anyone with an afternoon. And at the bottom, a human sign-off: a name, a date, and the sentence *I have reproduced this result and can explain the change.*

The project's longest-standing maintainer wanted to reject it on origin alone. His argument filled most of a thread: generated reports had consumed his volunteer hours for two years, he owed nobody the labour of reviewing machine output, and closing the gate entirely was the only sustainable policy he could afford.

Sofía read the thread twice, then the evidence once, then the disclosure header again, and entered the discussion the way she now entered every discussion: through what each party

could actually sign.

She asked the named person one question, publicly, where everyone could see it: explain the decisive step in your own words, at whatever length you need.

The answer came back the next morning: four paragraphs, slightly awkward, genuinely understood, describing why the scheduling boundary misbehaved and what the fix traded away to work. Not eloquent. Owned. The maintainer who had wanted to reject the report replied with a single word, *merged*, and a comment that made her smile at her kitchen table: *reviewing this cost me less than arguing about it.*

Elsewhere in the same week, smaller news that never made wire services. Micaela's dispatch tool ran its first full month under a disclosed-assistance arrangement maintained through Agustin's repair community: documented components, named maintainers and one module listed openly as *behaviour not fully understood; change requires two-person review*, because naming the gap had turned out to be the whole trick. The unexplainable component finally had a maintainer instead of a hope, and Micaela had stopped hiding how much she did not know from anyone, which her riders reported, via the building's grapevine, had made her easier to work for, not harder.

None of that put the previous world back. NamedWitness's second maintainer stayed in her closed internal job. The backlog fell only after the project capped new reports at the number of funded review hours, which meant useful submissions waited beside useless ones and some newcomers went elsewhere. At Piedra Sola, the machinist who now drove the shuttle did not regain the drawing work that automation had taken. Better rules could stop a system spending tomorrow's atten-

tion. They could not refund yesterday's years.

Ariel, the rider who had waited unpaid in the Almagro workshop, began taking one afternoon a week to learn the dispatch tool's test harness. He was not becoming a programmer in the heroic language of training brochures. He was becoming the second person who knew how to stop a bad route update before fifteen riders discovered it in traffic. Micaela paid for the afternoon. The queue ran slightly worse while he learned and became less fragile afterwards.

Agustin himself sent her the mirror's quarterly summary without comment: archive intact, both fork branches still running, attendance down, uptime boring, everything a commons should be. She sent back one line, *received*, and they left it there, both of them adults who knew exactly what had been repaired and what had merely survived.

On Friday, the replacement Banca Roveda card arrived downstairs.

The buzzer went at eleven, the courier held out the padded envelope, and Sofía signed for it with her real name while the card's digital successor sat already active on her phone, provisioned the day the request cleared, waiting in her wallet app like a fact that preceded its own evidence. She stood in the doorway holding the plastic that had been rendered ceremonial by its own infrastructure.

Then she disabled the digital card, all of it, every token and scheduled payment, recorded the event with a screenshot and a timestamped note, and filed the statement in the folder with everything else narrow and dated.

She would use a bank again. She would even use the phone; the audit trail on that decision belonged to future Sofía, and current Sofía had learned better than to certify on her behalf.

But the act of disabling it herself, recording it, keeping the statement: that was the part no replacement product offered, and it cost nothing except the willingness to look like a woman who did not trust her own wallet, which by now was simply accurate.

The envelope went into recycling. The phone went in her pocket. Upstairs, the scheduling library accepted contributions again under rules everyone could explain, and somewhere far to the southwest, in a sealed hall she hoped never to visit again, escrowed history waited for auditors patient enough to give dates their proper weight.

Sofía made coffee and opened her laptop to the merged thread one more time, not to re-read the fix but to look at the bottom of the report, where the whole argument ended and none of it mattered anymore:

a name beside the claim.

About the Author

Jacob Verhoeks writes technological thrillers grounded in systems that already exist. He has three decades of experience in IT, from on-premises infrastructure to cloud platforms, working around the world.

His fiction draws on public research, documented incidents, architecture and the practical texture of engineering: the compromises, assumptions and small human decisions inside complex systems. He is interested in open source, programming, ethical hacking, cloud systems and artificial intelligence. Nothing in his books draws on any employer's or client's non-public information; the views and events are his own.

His novels are works of fiction. Characters, companies, systems, incidents and conspiracies are invented or fictional composites. Real places, public technologies and documented events may provide setting or context.

He lives in the Netherlands.

A note on the technology

The conspiracies in this novel are fictional. The system classes, evidence problems and operational pressures are researched

from public documentation, standards and documented incidents. The story combines those ordinary behaviours into an invented sequence; it does not depict any real private network or undisclosed incident.

The novel deliberately leaves out credentials, live targets, exploit payloads and operational attack instructions. The technical details are here to make the human choices auditable, not to turn the story into a manual.

Real system classes. Fictional conspiracies. Human consequences.
